[Continued on next page]

(54) Title: RESIDENTIAL CARPET PRODUCT AND METHOD

(57) Abstract: A layered cushioned composite (110A) such as a carpet or carpet tile which in at least one embodiment incorporates a layer of stabilizing material (158) and a layer of adhesive material (160) below a primary carpet (112) and above a layer of compressed particle, recycled and/or rebond foam or cushioning material (178) and having special applicability to the residential market, especially the residential do-it-yourself market. In accordance with a preferred embodiment, the residential carpet tile has a high twist frieze face, a polyurethane rebond foam cushion, and a non-square shape providing for interlocking with adjacent or abutting carpet tiles.

Patent Application Serial No. 09/960,114, filed September 21, 2001, and is a
10 continuation-in-part of U.S. Patent Application Serial No. 09/910,085, filed July
20, 2001, all of which are hereby incorporated by reference herein.

FIELD OF THE INVENTION

The present invention relates to textile products, composites or constructions
15 such as surface coverings, wall coverings or floor coverings, including flooring,
carpet, carpet tile, components thereof, or the like. More particularly, the
present invention relates to a construction for a cushioned carpet composite or
carpet tile incorporating foam or cushion material such as rebond foam or
compressed particle foam having special applicability to the residential market,
20 especially the residential do-it-yourself market. Processes, methods and
apparatus for making, forming, installing, using, displaying, marketing,
merchandising, and/or the like the cushion or foam backed composites or
constructions of the present invention are also provided.

25 BACKGROUND OF THE INVENTION

All of the U.S. patents cited herein are hereby incorporated by reference.

U. S. Patent Nos. 4,522,857, 5,540,968, 5,545,276, 5,948,500, and 6,203,881
(all hereby incorporated by reference herein) describe carpet or carpet tiles
30 having cushioned backings. As described in U. S. Patent No. 5,948,500 and
as shown herein, an example of a tufted carpet product 10A is illustrated in

FIG. 1A and an example of a bonded carpet product 10B is illustrated in FIG. 1B.

5 In the tufted carpet 10A of Figure 1A, a primary carpet fabric 12 is bonded to an adhesive layer 16 in which is embedded a layer of glass scrim 18. A foam base composite 19 is likewise adhesively bonded to the adhesive layer 16. In such tufted carpet construction, the primary carpet fabric 12 includes a loop pile layer 20 tufted through a primary backing 22 such as a non-woven textile by a conventional tufting process and held in place by a pre-coat backing layer of latex 24 or other appropriate adhesive. The foam base composite 19 of the
10 tufted carpet product 10A includes an intermediate layer 26 molded to a layer of urethane foam 28 as illustrated.

The bonded carpet product 10B of FIG. 1B employs the same type of foam
15 base composite 19 adhesively bonded by adhesive laminate layer 16 in which is disposed a layer of glass scrim 18. However, the primary bonded carpet fabric 12 has somewhat different components from that of the tufted product 10A in that it has cut pile yarns 34 implanted in an adhesive 36 such as PVC, latex, or hot melt adhesive and has a woven or non-woven reinforcement or
20 substrate layer 38 of material such as fiberglass, nylon, polypropylene, or polyester.

The formation of a foam base composite 19 for use in prior cushioned carpeting constructions of either tufted or bonded configuration has typically
25 involved pre-forming and curing virgin urethane foam across a carrier or backing material. As described in U.S. Patent No. 4,522,857, such a foam base composite may be laminated to a carpet base thereby yielding a cushioned structure.

30 As described in the above-mentioned 5,948,500 patent, the cost associated with such modular formation and assembly practices may be reduced by a

simplified operation in which a primary carpet fabric, either with or without a stabilizing layer of scrim or the like, is laid directly into a polyurethane-forming composition and thereafter curing the polyurethane. The process can be made even more efficient if the polyurethane-forming composition requires no pre-curing prior to joining the carpet base.

Prior to the invention described in the 5,948,500 patent, the known processes directed to the application of the polyurethane cushioned backings to fabric substrates relied on the extremely close control of temperature in both the polyurethane composition and the adjoined fabric layer to effect stability through pre-cure of the polyurethane prior to lamination of the primary carpet to form a composite structure. Such pre-cure had been largely considered necessary in order to yield a stable foam structure to which the primary carpet backing could be applied. The application of heat to the polyurethane composition prior to joining of the heated fabric backing caused polymer cross linking which had been thought to be necessary to stabilize the foam mixture to a sufficient degree to prevent the collapse of the foam.

The 5,948,500 patent also describes a particularly simple composite structure amenable to continuous, in-line, or in-situ formation of a stable cushion carpet composite. Specifically, a single process is used to bring all the layers of the cushioned carpet composite together by laying a primary carpet fabric or a glass layer, either with or without some degree of preheat, directly into a mechanically frothed polyurethane-forming composition prior to curing the polyurethane and without an intermediate layer of material.

As described in one example of the 5,948,500 patent, the base of the primary carpet fabric is adhesively bonded to a layer of non-woven glass reinforcement material to form a preliminary composite. A puddle of polyurethane-forming composition is simultaneously deposited across a woven or non-woven backing material. The preliminary composite and the polyurethane-forming composition

are thereafter almost immediately brought together with the preliminary composite being laid into, and supported by, the polyurethane-forming puddle. The entire structure is then heated to cure the polyurethane forming composition. The preliminary composite may be slightly heated to about 120°F
5 to improve heating efficiency although the process may likewise be carried out without such preheating.

An excellent cushion backed carpet tile or modular cushion back carpet tile on the market today, for example, sold under the trademark Comfort Plus® by
10 Milliken & Company of LaGrange, Georgia has a structure similar to, for example Figures 3A or 3B of the 6,203,881 patent, and has a commercial primary carpet fabric with a face weight of about 20 to 40 oz/yd², a hot melt layer of about 38 to 54 oz/yd², a prime filled polyurethane foam cushion of about 0.10 to 0.2 inches thick, a cushion weight of about 28-34 oz/yd², a
15 cushion density of about 18 lbs. per cubic foot, and an overall product height of about 0.4 – 0.8 inches. This superior cushion back carpet tile provides excellent resilience and under foot comfort, exhibits performance characteristics that rate it for heavy commercial use, and has achieved a notable status throughout the industry as having excellent look, feel, wear,
20 comfort, and cushion characteristics, performance, properties, and the like. Such cushion backed carpet tile is relatively expensive to produce due to the high quality and quantity of materials utilized.

Although attempts have been made at reducing the cost of floor coverings or
25 carpet by using lower quality materials, such attempts have not been particularly successful. Low quality products tend to have a less than desirable look, feel, wear, comfort, cushion, and the like. Hence, most such products have not been accepted in the industry and have failed commercially.

30 One successful relatively lower cost floor covering, carpet, or carpet tile and process for producing such a product is described in U.S. Patent Application

Serial No. 09/587,654 and in published U. S. Patent Application 20020034606 A1, published March 21, 2002, each of which is hereby incorporated by references herein. The 09/587,654 application and 20020034606 publication each describe a process for producing a low weight composite structure
5 . amenable to continuous, in-line or in-situ formation as a stable cushion carpet composite. One embodiment of such a low weight cushion carpet composite incorporates a low face weight commercial primary carpet fabric of either tufted or bonded construction which is adhesively bonded to a layer of reinforcement material to form a preliminary composite. This preliminary composite is
10 thereafter laid into a puddle of prime filled polyurethane foam-forming material. The resulting structure is then heated to cure the polyurethane-forming material thereby yielding a cushioned structure.

Although attempts have been made at marketing carpet tile products for use in
15 the home as well as commercial environments, such as hardback carpet tiles for the kitchen, such attempts have not been completely successful. Hence, the residential carpet customer has been substantially limited in the choice of home carpet products, for example, to broadloom carpet installed by professional installers over a separate broadloom carpet pad. Installation of
20 broadloom carpet usually requires the installers to handle large 12 foot long rolls of carpet pad and of broadloom carpet. The broadloom carpet must be cut, seamed, and stretched over the pad before it is secured in position by tack strips along the wall. Installation of broadloom carpet is labor intensive and is usually done by professional installers rather than the homeowner.

25

Hence, there is a need for an improved carpet product and/or method especially for the residential or home market.

SUMMARY OF THE PRESENT INVENTION

At least one embodiment of the present invention provides a carpet product such as a roll product or carpet tile having special applicability to the residential market, especially the residential do-it-yourself market.

- 5 At least one embodiment of the present invention provides a residential carpet product, roll product or carpet tile product which addresses the disadvantages of prior carpet products.

- 10 At least one embodiment of the present invention provides a residential carpet product having a residential face such as a plush, cut pile, primary carpet fabric, hot melt tie coat, fiberglass reinforcement layer, rebond or prime foam cushion, and a felt backing material.

- 15 At least one embodiment of the present invention provides advantages and/or alternatives over previous textile products, composites or constructions such as surface coverings, wall coverings, or floor coverings by providing a relatively low cost, environmentally friendly, aesthetically pleasing, stable, and/or durable layered cushioned textile product, composite or construction which preferably incorporates a layer of cushioning or foam material incorporating compressible
- 20 particles bonded together, such as rebond foam or another compressed particle foam. The textile or carpet construction of the present invention is thus equally suitable for manufacture by a wide variety of techniques including lamination of a preformed pre-cured layer of foam material, lamination of a preformed primary carpet and a performed foam layer, or by an in-line
- 25 application process. It is contemplated that a layer or layers of resilient adhesive material may either be substantially discrete from one another or may be intermixed across a layer of stabilizing material if such stabilizing material is sufficiently porous. Accordingly, by the term "layers" is meant both such discrete and intermixed masses. The construction of the present invention is
- 30 thus characterized by substantial versatility in that it may be manufactured by both simple and more sophisticated manufacturing techniques.

In view of the foregoing, it is a general object of at least one embodiment of the present invention to provide at least one textile product, composite, or construction, such as a cushion or foam backed surface covering, wall covering, floor covering, flooring material, carpet, roll product, or carpet tile
5 having a foam layer or cushion formed of a material made up of compressible particles bonded together, such as rebond foam.

It is a further object of at least one embodiment of the present invention to provide a cushioned or foam backed carpet or carpet tile.
10

It is another object of at least one embodiment of the present invention to provide a carpet tile having a carpet with a yarn face weight of less than or equal to about 65 oz/yd².

15 It is another object of at least one embodiment of the present invention to provide a carpet tile having a resilient or hot melt layer of less than or equal to about 70 oz/yd².

It is yet another object of at least one embodiment of the present invention to provide a carpet tile having a lightweight face and/or cushion.
20

It is a further object of at least one embodiment of the present invention to provide a carpet tile having a lightweight cushion of about 0.04 to 0.50 inches thick, preferably 0.04 – 0.09 inches thick.
25

It is still another object of at least one embodiment of the present invention to provide a carpet tile having a rebond foam or compressed particle cushion with a density of less than or equal to about 25 lbs. per cubic foot.

It is yet another object of at least one embodiment of the present invention to provide a carpet tile having a rebond foam or compressed particle cushion with a density of about 4 - 25 lbs. per cubic foot.

- 5 It is a further object of at least one embodiment of the present invention to provide a carpet tile having a lightweight cushion with a weight of less than or equal to about 40 oz/yd².

- 10 It is a further object of at least one embodiment of the present invention to provide a carpet product or carpet tile having a foam material with a recycled foam and/or particle content.

- 15 It is a further object of at least one embodiment of the present invention to provide a carpet product or carpet tile having a backing with at least one flame laminated junction.

- 20 It is a further object of at least one embodiment of the present invention to provide a cushioned or foam backed carpet or carpet tile having a layer of compressible particles bonded together.

- It is still another object of at least one embodiment of the present invention to provide a carpet product or carpet tile with at least one rebond foam layer.

- 25 It is a general object of at least one embodiment of the present invention to provide at least one textile product, composite, or construction, such as a cushion or foam backed surface covering, wall covering, floor covering, flooring material, carpet, rug, runner, or carpet tile having a frieze face material and a foam layer or cushion.

It is a further object of at least one embodiment of the present invention to provide a cushioned or foam backed residential carpet, rug, runner, or carpet tile.

- 5 It is another object of at least one embodiment of the present invention to provide a carpet tile having a frieze, cut pile carpet with a yarn face weight of less than or equal to about 45 oz/yd².

- 10 It is a further object of at least one embodiment of the present invention to provide a residential carpet tile having a polyurethane cushion.

It is still another object of at least one embodiment of the present invention to provide a carpet tile having a rebond foam or compressed particle cushion.

- 15 It is a further object of at least one embodiment of the present invention to provide a residential carpet product or carpet tile having a foam material with a recycled foam and/or particle content.

- 20 It is a further object of at least one embodiment of the present invention to provide a residential modular carpet tile having resilience and under foot comfort.

- 25 It is still another object of at least one embodiment of the present invention to provide a modular carpet tile exhibiting performance characteristics that rate it for residential or home use.

- 30 It is a further object of at least one embodiment of the present invention to provide a method of forming foam or cushion backed residential textile products, such as flooring, carpet, roll product, runner, rug, carpet composite, carpet tile, or the like.

It is another object of at least one embodiment of the present invention to provide a method of forming a residential modular carpet tile having resilience, under foot comfort, the look and feel of broadloom carpet, seamless appearance when installed, which is easy to install, can be installed by the homeowner, facilitates do-it-yourself (D-I-Y) purchase and installation, and/or having performance characteristics that rate it for residential or home use.

It is a further object of at least one embodiment of the present invention to provide a process for the formation of a residential foam backed or cushioned carpet composite or tile including a primary carpet fabric, a reinforcement layer, a polyurethane cushion material, and a backing layer.

It is yet another object of at least one embodiment of the present invention that the residential carpet composite or carpet tile of the present invention may be tufted or dyed or printed with solid colors, orientation independent designs or patterns, or designs or patterns having the ability to seam properly without cutting the tiles in register with the design and to allow the carpet or tile to be installed monolithically as well as by conventional quarter turn "Parquet" or by Ashler (brick) techniques with or without floor adhesives.

20

In accordance with an exemplary object of at least one embodiment of the present invention, a residential modular carpet composite or tile having a shape of at least one of square, rectangular, straight sides with chevron ends, straight sides with multiple chevron ends, single or multiple chevron sides and ends, chevron sides with straight ends, multiple chevron sides with straight ends, triangular, diamond, hexagonal, octagonal, bone, double axe head, tomahawk, sine wave edge (two or more sides), crescent, or the like.

25

In accordance with a particular object of at least one embodiment of the present invention, a residential modular carpet composite, for example 6 feet or 12 feet wide, is cut into selected lengths or into modular carpet tiles or

30

carpet products such as shaped tiles, rectangles or squares, for example, 18 inches X 18 inches, 23 inches X 23 inches, 24 inches X 24 inches, 18 inches X 24 inches, 18 inches X 36 inches, 23 inches X 36 inches, 24 inches X 36 inches, 36 inches X 36 inches, 50 cm X 50 cm, 1 meter X 1 meter, 48 inches X 48 inches, or the like.

Also, in accordance with another object of at least one embodiment of the present invention, the residential carpet composite or carpet tile of the present invention may be installed on site or on flooring by any one of the conventional installation techniques as well as can be constructed for adhesive-free installation, self-stick, releasable adhesive, double sided tape, releasable fastening means, or the like.

Also, in accordance with still another object of at least one embodiment of the present invention, the residential carpet composite or carpet tile of the present invention may be tufted, dyed or printed with orientation dependent designs or designs having the ability to seam properly which require the tiles to be cut in register with the design and allow the carpet to be installed monolithically with or without floor adhesives.

The residential carpet composite of at least one embodiment of the present invention is especially adapted to be cut for use as modular carpet tiles, but also finds applicability as other carpet or flooring, such as, carpet, broadloom, roll product, area rugs, runners, floor mats, or the like.

In accordance with at least one embodiment of the present invention, a residential cushioned carpet composite or tile is provided with a friction or adhesion enhancing backing surface, material, or composite such as a textured or embossed surface, a tacky surface, an adhesive surface such as a coating or surface treatment, a magnetic sheet, magnetic strips, and/or the like.

In accordance with at least one embodiment of the present invention, there is provided a residential foam or cushion backed carpet or flooring composite such as 3, 6, or 12 foot wide cushioned broadloom or roll product, 4 foot X 8 foot cushioned sheets or tiles, 4 foot X 4 foot cushioned sheets or tiles, 36 inch X 36 inch tiles, 1 meter X 1 meter tiles, rectangular tiles, shaped tiles, and the like.

It is a further object of at least one embodiment of the present invention to provide a carpet product or carpet tile having a delamination strength greater than 5 lbs. per linear inch per ASTM 3936.

It is a further object of at least one embodiment of the present invention to provide a modular carpet tile having resilience and under foot comfort.

It is still another object of at least one embodiment of the present invention to provide a modular carpet tile exhibiting performance characteristics that rate it for heavy commercial use.

It is a further object of at least one embodiment of the present invention to provide a method of forming foam or cushion backed textile products, such as flooring, carpet, carpet composite, carpet tile, or the like.

It is another object of at least one embodiment of the present invention to provide a method of forming a modular carpet tile having resilience, under foot comfort, and performance characteristics that rate it for commercial use.

It is an object of at least one embodiment of the present invention to provide a foam backed or cushioned carpet composite or tile wherein a reinforcement layer is disposed in or below a primary carpet.

It is a related object of at least one embodiment of the present invention to provide a foam backed or cushioned carpet composite or tile wherein a primary carpet fabric is joined to a reinforcement layer and a foam, compressible, or cushion backing.

5

It is a further object of at least one embodiment of the present invention to provide a process for the formation of a foam backed or cushioned carpet composite or tile including a primary carpet fabric, a reinforcement layer, a polyurethane cushion material, and a backing layer.

10

It is still a further related object of at least one embodiment of the present invention to provide a continuous process for the formation of a foam backed or cushioned carpet composite having a reinforcement layer between a primary carpet and a backing layer.

15

It is a further object of at least one embodiment of the present invention to provide a process for the formation of a foam backed or cushion backed carpet composite or product having a primary carpet fabric and a cushion backing attached thereto by an adhesive layer.

20

It is still a further related object of at least one embodiment of the present invention to provide an apparatus for carrying out the continuous formation of a foam backed or cushioned carpet composite.

25 It is yet another object of at least one embodiment of the present invention that the carpet composite and carpet tile of the present invention may be printed with orientation independent designs or designs having the ability to seam properly without cutting the tiles in register with the design and to allow the carpet to be installed monolithically as well as by conventional quarter turn
30 "Parquet" or by Ashler (brick) techniques with or without floor adhesives.

In accordance with an exemplary object of at least one embodiment of the present invention, a modular carpet composite which may be cut to form modular carpet tiles includes a primary carpet or greige carpet having, for example, a face weight of less than or equal to about 45 oz/yd², a hot melt
5 layer of less than or equal to about 70 oz/yd², and a cushion of about 0.04 – 0.50 inches thick. The cushion may have a density of about 25 lbs. per cubic foot or less.

It is still another object of at least one embodiment of the present invention to
10 provide a modular carpet composite or modular carpet tile incorporating compressed particle foam or rebond foam preferably having recycled content and having unexpectedly excellent look, wear, cushion, resilience, under foot comfort, and performance characteristics that rate it for heavy commercial use. Hence, such a carpet composite or carpet tile may be used in place of
15 standard cushion backed or hard backed carpet tile, or broadloom carpet thus reducing cost, reducing material requirements, reducing weight, reducing energy requirements, reducing environmental impact, and/or the like.

In accordance with a particular object of at least one embodiment of the present invention, a modular carpet composite, for example 6 feet or 12 feet
20 wide, is cut into modular carpet tiles or carpet squares, for example, 18 inches X 18 inches, 36 inches X 36 inches, 50 cm X 50 cm, 1 meter X 1 meter, 48 inches X 48 inches, or the like.

25 Also, in accordance with another object of at least one embodiment of the present invention, the carpet composite or carpet tile of the present invention may be installed on site or on flooring by any of the conventional installation techniques as well as can be constructed for adhesive-free installation, self-stick, or the like.

Also, in accordance with still another object of at least one embodiment of the present invention, the carpet composite and carpet tile of the present invention may be printed with orientation dependent designs or designs having the ability to seam properly which require the tiles to be cut in register with the design and
5 allow the carpet to be installed monolithically with or without floor adhesives.

In accordance with at least one embodiment of the present invention, it has been unexpectedly discovered that a carpet composite or carpet tile having excellent look, feel, wear, resilience, and underfoot comfort and exhibiting
10 performance characteristics that rate it for heavy commercial use can be formed by combining a primary carpet with a hot melt or resilient layer and a rebond foam cushion.

In accordance with at least one embodiment of the present invention, a low
15 weight modular carpet tile is provided having an overall height of about 0.10 to 0.75 inches thick, preferably 0.20 to 0.50 inches thick, depending on the construction of the carpet tile (the number of layers or components) and which can be cut in any conventional shape or size.

20 The carpet composite of at least one embodiment of the present invention is especially adapted to be cut for use as modular carpet tiles, but also finds applicability as other carpet or flooring, such as, carpet, broadloom, area rugs, runners, floor mats, or the like.

25 It is a feature of at least one embodiment of the present invention to provide a cushioned carpet composite or carpet tile including a primary carpet fabric in laminar relation to a reinforcement layer wherein such reinforcement layer is at least partially embedded in a rebond foam layer. The reinforcement layer may be bonded to the base of the primary carpet fabric and/or the polyurethane
30 foam.

It is a feature of at least one embodiment of the present invention to provide a cushioned carpet composite or carpet tile including a primary carpet fabric in laminar relation to a polyurethane foam layer which is disposed adjacent to a non-woven backing layer.

5

It is a feature of at least one embodiment of the present invention to provide a cushioned carpet composite or carpet tile including a primary carpet fabric in laminar relation to a reinforcement layer and a rebond foam layer. The reinforcement layer may be bonded to the base of the primary carpet fabric and/or the polyurethane foam.

10

It is a further feature of at least one embodiment of the present invention to provide a process for forming a cushioned carpet composite including the simultaneous continuous steps of adhering at least one reinforcement material to the base of a primary carpet fabric and/or to the upper surface of a cushion layer.

15

It is a further feature of at least one embodiment of the present invention to provide a process for forming a cushioned carpet composite including the steps of adhering a reinforcement material to the base of a primary carpet fabric and adhering a rebond polyurethane foam and backing layer to the reinforcement material.

20

It is a further feature of at least one embodiment of the present invention to provide a process for forming a cushioned carpet composite including the steps of forming or obtaining a primary carpet fabric, forming or obtaining a rebond polyurethane foam layer, and adhering the primary carpet fabric to the rebond polyurethane foam layer.

25

It is yet a further feature of at least one embodiment of the present invention to provide an apparatus for use in the continuous in-line formation of a cushioned

30

carpet composite wherein the apparatus includes at least one adhesive application unit or apparatus for adhering a reinforcement layer to the base of a primary carpet fabric and/or to the upper surface of a foam layer.

- 5 It is yet a further feature of at least a selected embodiment of the present invention to provide an apparatus for use in the formation of a cushioned carpet composite wherein the apparatus includes a polymer application unit for depositing an adhesive composition or other suitable polymer to the base of a primary carpet fabric and the upper surface of a foam or cushion layer.

10

It is yet a further feature of at least one embodiment of the present invention to provide an apparatus for use in the formation of a cushioned carpet composite wherein the apparatus includes an adhesive application apparatus for adhering a reinforcement layer to the base of a primary carpet fabric.

15

- In accordance with at least one embodiment of the present invention, a foam backed or cushioned carpet, composite, or tile is provided. The cushioned carpet includes a primary carpet having a primary base and a plurality of pile-forming yarns projecting outwardly from one side. A layer of reinforcement material is bonded to the primary base on the side away from the pile-forming yarns. The reinforcement material is adjacent to, and attached to a foam or cushion layer such as rebond foam. An optional backing material is preferably disposed on the underside of the cushion layer. The backing material may include an adhesive backing on the side away from the cushion layer.

25

- In accordance with at least one embodiment of the present invention, a foam backed cushioned carpet, composite, or tile is provided. The cushioned carpet includes a primary carpet having a primary base and a plurality of pile-forming yarns projecting outwardly from one side. A layer of reinforcement material is bonded to the primary base on the side away from the pile-forming yarns. The reinforcement material is adjacent to a foam or cushion layer of polymer such

30

as polyurethane rebond foam. An optional backing material is preferably disposed on the underside of the cushion layer. The backing material may include an adhesive backing on the side away from the cushion layer.

- 5 In accordance with at least one embodiment of the present invention, a foam backed or cushioned carpet, composite, or tile is provided. The cushioned carpet includes a primary carpet having a primary base and a plurality of pile-forming yarns projecting outwardly from one side. A cushion layer is bonded to the primary base on the side away from the pile-forming yarns. A
- 10 reinforcement material may be embedded in the cushion layer such as two layers of polyurethane rebond foam. The cushion layer may be bonded to the primary carpet by a layer of adhesive such as hot melt. An optional backing material is preferably disposed on the underside of the cushion layer. The backing material may include an adhesive backing on the side away from the
- 15 cushion layer.

In accordance with at least one embodiment of the present invention, a process for making a cushioned carpet is provided. The process involves producing or obtaining a primary carpet fabric comprising a plurality of pile-

20 forming yarns extending outwardly from one side of a primary base. A layer of reinforcement material is adhered to the primary carpet fabric on the side, from which the pile-forming yarns do not extend, thereby forming a preliminary composite. The preliminary composite is then adhered to a foam or cushion layer. Following this mating operation, the carpet is rolled, slit, or cut to size or

25 into tiles.

In accordance with at least one embodiment of the present invention, a process for making a foam backed or cushioned carpet is provided. The process involves obtaining a primary carpet fabric comprising a plurality of pile-

30 forming yarns extending outwardly from one side of a primary base. The primary carpet fabric is then attached to a foam or cushion layer. Following

this mating operation, the composite is preferably heat cured, coded, and then the carpet is cut into tiles.

In accordance with at least one embodiment of the present invention, a process for making a foam backed or cushioned carpet is provided. The process involves obtaining a primary carpet fabric comprising a plurality of pile-forming yarns extending outwardly from one side of a primary base. A layer of reinforcement material is adhered to the primary carpet fabric on the side from which the pile-forming yarns do not extend, thereby forming a preliminary composite. The preliminary composite is then attached to a rebond foam or cushion layer. Following this mating operation the composite is rolled, slit, or cut into tiles.

In accordance with at least one embodiment of the present invention, an apparatus for use in forming a foam backed or cushioned carpet composite is provided. The apparatus includes a reinforcement bonding unit for bonding a layer of reinforcement material to the underside of a primary carpet fabric to form a preliminary carpet composite, a mating unit for mating the preliminary carpet composite to a foam or cushion layer, and wherein the reinforcement bonding unit and the mating unit are operable in a continuous, simultaneous manner.

In accordance with at least one embodiment of the present invention, an apparatus for use in forming a foam backed or cushioned carpet composite is provided. The apparatus includes a reinforcement bonding unit for bonding a layer of reinforcement material to the underside of a primary carpet fabric to form a preliminary carpet composite, a polymer application unit for dispersing a polymer composition across the surface of a cushion layer, and a mating unit for joining the carpet composite and cushion layer.

In accordance with at least one embodiment of the present invention, an apparatus for use in forming a foam backed or cushioned carpet composite is provided. The apparatus includes a reinforcement bonding unit for bonding a layer of reinforcement material to the underside of a primary carpet fabric and
5 to the top side of a cushion layer to form a carpet composite.

In accordance with at least one embodiment of the present invention, a modular carpet tile is manufactured by:

tufting broadloom at a weight of about 45 oz/yd² or less,
10 printing a design in broadloom form,
applying a rebond foam or cushion backing system, and
cutting into carpet tiles.

The potentially preferred modular carpet tile of at least one embodiment of the
15 present invention is aesthetically pleasing and exhibits performance characteristics that rate it for commercial, hospitality, institutional, and/or residential use. The combination of a carpet fabric, adhesive, and cushion backing also provides resilience and under-foot comfort.

20 The carpet, composite, and tile of at least one embodiment of the present invention is especially suited for broadloom or roll product because of:

- a. Tufted construction carpet
- b. Applied design, pattern, or color
- c. Attached rebond foam or cushion backing

25

In at least one embodiment of the present invention, a composite foam backed or cushioned carpet or tile is provided wherein a reinforcement layer is disposed intermediate discrete or intermixed layers of resilient polymeric adhesive below a primary carpet and above a foam or cushion layer such that
30 at least a portion of the polymeric adhesive is disposed on and extends away from either side of the reinforcement layer.

According to at least one embodiment of the present invention, a construction of a foam backed or cushioned carpet composite is provided wherein a reinforcement layer is disposed intermediate discrete or intermixed layers of resilient polymeric adhesive below a primary carpet and adjacent the upper surface of a foam layer such that the polymeric adhesive bonds the primary carpet to the foam layer with the reinforcement layer disposed at an intermediate position between the primary carpet and the foam layer.

According to at least one embodiment of the present invention, a foam backed or cushioned carpet composite is provided wherein a reinforcement layer of fiber glass is disposed intermediate discrete or intermixed layers of resilient polymeric adhesive below a primary carpet and above a foam layer such that at least a portion of the material forming the polymeric adhesive is disposed on at least one side of the reinforcement layer.

According to at least one embodiment of the present invention, a foam backed or cushioned carpet composite is provided wherein a reinforcement or stabilizing layer or material is disposed intermediate discrete or intermixed layers of resilient polymeric adhesive below a primary carpet and above a foam layer such that at least a portion of the material forming the polymeric adhesive is disposed on at least one side of the reinforcement layer.

According to at least one embodiment of the present invention, a foam backed or cushioned carpet composite or tile is provided wherein a reinforcement or stabilizing layer is disposed intermediate discrete or intermixed layers of adhesive below a primary carpet and above a foam or cushion layer such that at least a portion of the adhesive is disposed on at least one side of the reinforcement or stabilizing layer.

According to at least one embodiment of the present invention, a rebond foam backed or cushioned carpet composite is provided wherein at least one reinforcement layer or material is disposed below a primary carpet and above a foam or cushion layer such that at least a portion of adhesive is disposed on at least one side of the reinforcement layer or material.

According to at least one embodiment of the present invention, a cushioned carpet composite is provided wherein a reinforcement layer of glass material is disposed adjacent at least one layer of adhesive below a primary carpet and above a foam layer such that at least a portion of the adhesive is disposed on at least one side of the reinforcement layer.

According to at least one embodiment of the present invention, a foam backed or cushioned carpet composite is provided wherein at least one reinforcement layer is disposed intermediate a primary carpet and a foam or cushion layer.

According to at least one embodiment of the present invention, a foam backed or cushioned carpet composite is provided wherein a reinforcement or stabilizing layer is disposed below a primary carpet.

According to at least one embodiment of the present invention, a foam backed or cushioned carpet composite is provided wherein a reinforcement or stabilizing layer is disposed above a foam or cushion layer.

According to at least one embodiment of the present invention a foam backed or cushioned carpet composite is provided having at least one reinforcement or stabilizing layer.

According to at least one embodiment of the present invention, a foam backed or cushioned carpet composite is provided with a primary carpet above a foam or cushion layer.

According to at least one embodiment of the present invention, a foam backed or cushioned carpet composite is provided wherein a reinforcement or stabilizing material or layer is disposed in or adjacent a primary carpet or a
5 foam or cushion layer.

According to at least one embodiment of the present invention, a foam backed or cushioned carpet composite is provided with at least one layer of a thermoplastic or thermoset adhesive.

10

According to at least one embodiment of the present invention, a process is provided to form a foam backed or cushioned carpet composite.

15

According to at least one embodiment of the present invention, a lamination process is provided to form a foam backed or cushioned carpet.

According to at least one aspect of the present invention an in-line process is provided to form a foam backed or cushioned carpet composite.

20

In accordance with at least one embodiment of the present invention, a cushioned carpet composite or tile is provided wherein a reinforcement layer of non-woven glass is disposed between layers of a hot melt polymeric adhesive below a primary carpet and above a foam layer such that the hot melt polymeric adhesive extends in joining relation between the primary carpet and
25 one side of the foam layer with the reinforcement layer being held within the hot melt polymeric adhesive at a position between the foam layer and the primary carpet such that at least a portion of the hot melt polymeric adhesive extends away from either side of the reinforcement layer. An optional backing material or multi-component backing composite may be disposed on the
30 underside of the cushion layer.

In accordance with at least one particular example or embodiment of the present invention, a preformed rebond foam or pad is used to manufacture a commercial grade cushion carpet tile. A rebond pad of approximately 13 pounds/cubic foot density is modified by, for example, flame lamination to have a respective non-woven material bonded to each of the upper and lower surfaces thereof. The composite rebond pad has a thickness of approximately .25" and is slit in half, producing two foam backings, each approximately .125" thick with a non-woven material attached to one surface. Next, each of the slit backings is directly bonded using a hotmelt adhesive to either pre-coated tufted carpet or latex based bonded carpet (with or without a reinforcement material) and then cut into tiles.

In accordance with at least one embodiment of the present invention, a cushioned carpet composite or tile is provided with a friction or adhesion enhancing backing surface, material, or composite such as a textured or embossed surface, a tacky surface, an adhesive surface, a magnetic sheet, magnetic strips, and/or the like.

In accordance with at least one embodiment of the present invention, there is provided a foam or cushion backed carpet or flooring composite such as 6 foot wide cushioned broadloom, 12 foot wide cushioned broadloom, 4 foot X 8 foot cushioned sheets or tiles, 4 foot X 4 foot cushioned sheets or tiles, 36 inch X 36 inch tiles, 1 meter X 1 meter tiles, rectangular tiles, shaped tiles, and the like.

In accordance with at least one embodiment, there is provided a residential carpet tile or carpet product that can preferably be installed on a residential floor with a substantially seamless appearance (no visible seams). There are several factors why seams between the installed tiles can be virtually invisible to an observer in a room:

1. Substantially equal density of yarn at the tile joint or seam line compared to the interior surface of the tile.
2. Cutting the product with controlled depth cutting from the back that cuts through the carpet backing and not through the yarn. Nearly 100% of the
5 yarn is preserved at the cut edge.
3. A cut pile construction allows for controlled depth cutting.
4. A lot of yarn that extends past the vertical plane of the tile edge allows the modular units to look nearly seamless immediately after installation.
5. High twist frieze yarn a yarn that wants to spill over the edge of the vertical
10 tile plane. The liveliness of this yarn and density of the carpet pile creates a lateral force that pushes the yarn past the tile edge.
6. A non-linear edge on a non-square shaped tile minimizes the continuous linear segment lengths of a tile joint. This further breaks up the tile seam line and makes it less noticeable to the human eye.
- 15 7. An installation method that off-sets the position of the tile into a brick-like or Ashlar pattern also reduces the continuous linear segment length of a tile joints.

BRIEF DESCRIPTION OF THE DRAWINGS

- 20 Certain exemplary embodiments or examples of the present invention will be presented below with reference to the accompanying drawings which are incorporated in and which constitute a part of this specification and in which:

FIG. 1A is a cut-away side view of a tufted carpet with a cushioned composite
25 structure;

FIG. 1B is a cut-away side view of a bonded carpet incorporating a cushioned composite structure;

FIG. 2 is a schematic process diagram illustrating an assembly process for forming a carpet construction according to one embodiment of the present invention;

- 5 FIG. 3A is a cut-away side view of a carpet construction according to an embodiment of the present invention incorporating a loop pile tufted primary carpet surface;

- 10 FIG. 3B is a cut-away side view of a carpet construction according to another embodiment of the present invention incorporating a cut loop or cut pile tufted primary carpet surface;

- 15 FIG. 3C is a cut-away side view of a carpet construction according to still another embodiment of the present invention incorporating a cut pile bonded primary carpet surface;

- 20 FIG. 4 is a schematic process diagram illustrating an assembly process for forming a carpet construction according to another embodiment of the present invention;

FIG. 5 is a schematic of a process line for assembly of a carpet construction according to still another embodiment of the present invention;

- 25 FIG. 5A is a schematic of a process line for assembly of a carpet construction according to yet another embodiment of the present invention;

FIG. 5B is a view similar to FIG. 5 and illustrating an alternative process line for assembly of a carpet construction according to still yet another embodiment of the present invention;

FIG. 6A is a cut-away side view of an alternative embodiment of a loop pile tufted carpet construction having no separate adhesive pre-coat;

FIG. 6B is a cut-away side view of an alternative embodiment of a cut pile tufted carpet construction having no separate adhesive pre-coat;

FIG. 7A is a cut-away side view of an alternative embodiment of a loop pile tufted carpet construction having a reinforcement layer disposed between two different adhesive layers;

FIG. 7B is a cut-away side view of an alternative embodiment of a cut pile tufted carpet construction having a reinforcement layer disposed between two different adhesive layers;

FIG. 7C is a cut-away side view of an alternative embodiment of a bonded carpet construction having a reinforcement layer disposed between two different adhesive layers;

FIG. 8A is a cut-away side view of an alternative embodiment of a loop pile tufted carpet construction having a reinforcement layer disposed between two layers of latex adhesive;

FIG. 8B is a cut-away side view of an alternative embodiment of a cut pile tufted carpet construction having a reinforcement layer disposed between two layers of latex adhesive;

FIG. 9A is a cut-away side view of an alternative embodiment of a loop pile tufted carpet construction having glass reinforcement disposed across the underside of the primary backing;

FIG. 9B is a cut-away side view of an alternative embodiment of a cut pile tufted carpet construction having glass reinforcement disposed across the underside of the primary backing;

- 5 FIG. 10A is a cut-away side view of an alternative embodiment of a loop pile tufted carpet construction including a multi-component backing composite;

FIG. 10B is a cut-away side view of an alternative embodiment of a cut pile tufted carpet construction including a multi-component backing composite;

10

FIG. 10C is a cut-away side view of an alternative embodiment of a bonded carpet construction including a multi-component backing composite;

- 15 FIG. 11A is a cut-away side view of an alternative embodiment of a loop pile tufted carpet construction including a foam cushion with no backing;

FIG. 11B is a cut-away side view of an alternative embodiment of a cut pile tufted carpet construction including a foam cushion with no backing;

- 20 FIG. 11C is a cut-away side view of an alternative embodiment of a bonded carpet construction including a foam cushion with no backing;

- 25 FIG. 12A is a cut-away side view of an alternative embodiment of a loop pile tufted carpet construction including a foam cushion with a releasable adhesive backing;

FIG. 12B is a cut-away side view of an alternative embodiment of a cut pile tufted carpet construction including a foam cushion with a releasable adhesive backing;

30

FIG. 12C is a cut-away side view of an alternative embodiment of a bonded carpet construction including a foam cushion with a releasable adhesive backing;

- 5 FIG. 13A is a cut-away side view of an alternative embodiment of a loop pile tufted carpet construction including a multi-component composite backing including a releasable adhesive underside;

- 10 FIG. 13B is a cut-away side view of an alternative embodiment of a cut pile tufted carpet construction including a multi-component composite backing including a releasable adhesive underside;

- 15 FIG. 13C is a cut-away side view of an alternative embodiment of a bonded carpet construction including a multi-component composite backing including a releasable adhesive underside;

FIG. 14A is a cut-away view of another embodiment of a tufted carpet construction with a cushioned composite structure.

- 20 FIG. 14B is a cut-away side view of another embodiment of a bonded carpet construction incorporating a cushioned composite structure;

FIG. 15A is a cut-away side view of still another embodiment of a tufted carpet construction incorporating a structure formed by the apparatus and process of the present invention;

25

FIG. 15B is a cut-away side view of still another embodiment of a bonded carpet construction incorporating a structure formed by the apparatus and process of the present invention;

FIG. 15C is a cut-away side view of still another embodiment of a cut pile tufted carpet construction incorporating a structure formed by the apparatus and process of the present invention;

FIG. 50 is a cut-away side view construction or layer diagram of one potentially preferred cut pile tufted composite or tile in accordance with one embodiment or example of the present invention;

- 5 FIG. 51 is a schematic top plan view of a plurality of shaped carpet tiles with each tile having a single chevron on two opposing sides;

FIG. 52 is a schematic top plan view of a plurality of shaped carpet tiles with each tile having a triple chevron on two opposing sides thereof;

10

FIG. 53 is a schematic top plan view of a plurality of shaped carpet tiles with each tile having a single chevron on all four sides thereof;

- 15 FIG. 54 is a schematic top plan view of a plurality of shaped carpet tiles with each tile having a curved element on all four sides thereof;

FIG. 55 is a schematic top plan view of a plurality of square carpet tiles arranged aligned (monolithically);

- 20 FIG. 56 is a schematic top plan view of a plurality of square carpet tiles arranged in offset rows (brick or Ashlar);

FIG. 57 is a schematic top plan view of a plurality of rectangular carpet tiles;

- 25 FIG. 58 is a schematic top plan view of a plurality of triangular carpet tiles;

FIG. 59 is a schematic top plan view of a plurality of diamond shaped carpet tiles;

- 30 FIG. 60 is a schematic top plan view of a plurality of hexagonal shaped carpet tiles;

FIG. 61 is a schematic top plan view of another exemplary example of a shaped carpet tile having a double chevron on two opposing sides or ends thereof;

- 5 FIG. 62 is a schematic top plan view of a cutting pattern of cutting the shaped tiles of FIGS. 48, 49 or 61 from a length of carpet composite or carpet tile precursor;

- 10 FIG. 63 is a schematic top plan view of a monolithic installation of the tiles of FIGS. 48 or 61;

- FIG. 64 is a schematic top plan view of an Ashlar type installation of the tiles of FIGS. 48 or 61 and with edge tiles or cut tile pieces finishing out the installation;

15

FIGS. 65A and 65B relate to one embodiment of controlled depth or partial depth cutting of carpet tiles;

- 20 FIG. 65A is a schematic side view illustration of an ultrasonic double-sided blade ready to engage a carpet composite that is to be cut, for example, into individual carpet tiles;

- FIG. 65B is a schematic side view illustration of the ultrasonic double-sided blade cutting through the backing of the carpet composite of FIG. 65A;

25

FIGS. 66A and 66B relate to an alternative embodiment of a process of controlled depth cutting of carpet tiles;

- 30 FIG. 66A is a schematic side view illustration of a cutting blade such as a die blade ready to cut through the backing of a carpet composite such as a carpet tile precursor; and,

FIG. 66B is a schematic side view of the cutting blade cutting through the backing of the carpet composite (but not through the face yarn).

While the invention has been illustrated and will hereinafter be described and disclosed in connection with certain preferred embodiments, examples, practices and procedures, it is by no means intended to limit the invention to such specific embodiments, examples, practices and procedures. Rather it is intended to cover all such alternatives and modifications thereto as may fall within the true spirit and scope of the invention and all equivalents thereto as defined and limited only by the claims appended hereto.

DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

In accordance with at least one embodiment of the present invention, a cushioned composite or construction suitable for use in covering surfaces or products such as surface coverings, wall coverings and floor coverings or products including broadloom carpeting or flooring or modular carpet tile is provided. Referring to FIGS. 2, 3A, 3B and 3C of the drawings, a basic assembly procedure of components within a carpet construction according to the present invention is provided. As illustrated and according to a potentially preferred embodiment, the tufted and bonded carpet constructions 110A, 110B, 110C of the present invention incorporate a layered arrangement of a pile forming primary carpet fabric 112 in overlying relation to a sheet of reinforcement material 158, which in turn is disposed in overlying relation to a layer of cushioning or foam 178, such as rebond foam or compressed particle foam which may include an optional backing layer 170 (FIGS. 3A, 3B, 3C) or multi-component backing composite (FIGS. 10A-C and 13A-C) as will be described further hereinafter. The optional backing layer 170 is preferably a woven or non-woven textile fabric of polyester, polypropylene, polyester/polypropylene, polyester/polypropylene/acrylic, or other appropriate fibers or blends and may contain a colorant, binder, or the like. A non-woven structure of about 80% polyester fiber and about 20% polypropylene fiber,

about 50% polyester fiber and about 50% polypropylene fiber, or about 100% polyester fiber may be particularly preferred depending on the face construction of the composite.

- 5 Also, a blend of 50% polyester fiber, 20% polypropylene, and 30% acrylic fibers may be used. The polyester, polypropylene and/or acrylic fibers may be of one or more selected colors to give the backing a desired color or appearance. In one embodiment, the foam and backing have a similar color. In a particular example, the foam and/or backing have a green, blue, purple,
10 gray, white, black, brown, or gold color. The color of the backing can be achieved, for example, by using a white polyester fiber and a colored acrylic fiber or by using colored polyester and/or polypropylene fibers. In accordance with another example, an amount of black polyester fibers is blended with an amount of white polyester fibers, an amount of colored polyester fibers, and an
15 amount of white polypropylene fibers to form a non-woven colored backing material or felt having the color of the colored polyester fibers and having a heathered or speckled look. The respective amounts of each type or color of fiber are selected to give the desired color, brightness, etc.
- 20 The sheet of reinforcement material 158 is preferably embedded between layers of adhesive 160 such as a thermoplastic adhesive or thermoset adhesive, preferably a hot melt adhesive or the like extending on either side of the sheet of reinforcement material 158 to establish a bonding relationship between the primary carpet fabric 112 and the cushioning or foam layer 178.
25 As previously indicated, such layers of adhesive 160 may be either substantially discrete with the reinforcement material or layer 158 establishing a barrier between such layers or the layers of adhesive 160 may be at least partially intermixed across the reinforcement material 158. In either event, due to the intimate bonding relationship between the reinforcement material 158
30 and the layers of adhesive 160, the layers of adhesive 160 in combination with the reinforcement material 158 forms a bridging composite of substantial

stability extending between the cushion or foam layer 178 and the primary carpet fabric 112.

It is contemplated that the primary carpet fabric 112 may incorporate either a
5 tufted or a bonded configuration (with loop and/or cut pile) as described in
relation to FIGS. 1A and 1B and FIGS. 3A, 3B, and 3C. It is also contemplated
that the primary carpet 112 may take on any number of other pile forming or
non-pile forming constructions including by way of example only and not
10 limitation, flat or textured fabrics having woven, knit, or non-woven
constructions (FIGS. 36 – 37).

According to one potentially preferred embodiment, the primary carpet fabric
112 preferably includes a plurality of pile-forming yarns projecting outwardly
from one side of a primary base. If the primary carpet 112 used in the present
15 invention is a tufted carpet as illustrated in FIGS. 3A and 3B, its configuration
will preferably conform substantially to that of the primary carpet 12 illustrated
in FIG. 1A, with the difference that the pile forming yarns 121 of the
embodiment shown in FIG. 3B have undergone a tip shearing or loop cutting
operation to yield a cut pile construction. If the primary carpet 112 used in the
20 present invention is a bonded product as illustrated in FIG. 3C, its configuration
will preferably be that of the bonded primary carpet 12 illustrated in FIG. 1B. It
is contemplated that the primary carpet may include one or more backing or
base layers.

25 Although certain embodiments are preferred, it is to be understood that the
primary carpet fabric 12 may have different embodiments, and the component
structure of the primary carpet fabric 112 is not limited. Rather it is intended
that any primary carpet fabric having a pile forming portion and a primary base
or backing may be utilized as the primary carpet fabric. By "primary base" is
30 meant any single layer or composite structure including, inter alia, the
commonly used layered composite of primary backing 22 and latex pre-coat 24

previously described in relation to the tufted product (FIG. 1A) and the adhesive layer 36 with reinforcement substrate 38 previously described in relation to the bonded product (FIG. 1B). As will be appreciated, the use of polyester or a stabilized material in the primary base structure may be desirable due to the eventual heat curing such structure may undergo. Other embodiments as may occur to those of skill in the art may, of course, also be utilized. For example, in the bonded product, the pile forming yarns can be heat tacked to the substrate 38 as described in U. S. Patent No. 5,443,881 (hereby incorporated by reference herein) to permit simplified construction of a primary carpet. Alternative embodiments including those disclosed in U.S. Pat. No. 4,576,665 to Machell (incorporated by reference) may likewise be utilized. For example, it is contemplated that specialized primary backings such as non-woven structures comprising fiberglass sandwiched between layers of polyester may be utilized in the primary tufted carpet to impart the desired properties relating to stability thereby potentially reducing or even eliminating the need for the secondary backing or the latex pre-coat presently utilized in the manner to be described further hereinafter. Alternative primary backing or tufting substrate embodiments are described, for example, in pending U.S. Patent Application Serial No. 10/098,053, filed March 12, 2002 (hereby incorporated by reference herein). In particular, a possibly preferred primary backing or tufting substrate comprises a multi-component structure of a woven layer, a non-woven material needle punched through the woven layer, with at least a portion of the non-woven material being a low melt material which when subjected to calendering (pressure and heat) melts and fuses the non-woven and woven materials to form an enhanced primary backing. In accordance with one particular example, the woven layer is a woven polypropylene, the non-woven material is polyester, and the low melt material is low melt polyester. In accordance with one very specific example, a ratio of 30% by weight low melt polyester fiber and 70% by weight polyester fibers is preferred. Moreover, it is contemplated that if a pre-coat is to be utilized, it may be added

directly in-line in an operation prior to any adhesive bonding operation (FIG. 5A).

With regard to one embodiment, in the tufted carpet construction 110A of the present invention (FIG. 3A), the primary carpet fabric 112 preferably comprises a loop pile layer of pile-forming yarns 120 tufted into a primary backing 122 as is well known and held in place by a pre-coat layer 124 of a bonding material or adhesive such as latex, a hot melt adhesive or a urethane based adhesive. It is contemplated that the pre-coat layer 124 may be applied to the primary backing 122 either in a preliminary processing step during formation of the primary carpet fabric 112 or may be added in-line during formation of the cushioned carpet construction in a manner to be described further hereinafter in reference to FIG. 5A. The primary carpet fabric 112 may be steamed and/or heated after addition of the pre-coat layer 124 to facilitate subsequent printing operations, such as direct or indirect jet dyeing or printing, and/or if desired to reduce stresses. Further, the primary carpet fabric 112 may be printed or dyed prior to addition of the reinforcement material 158 and/or layer of cushioning material or foam 178.

Many techniques have been developed for patterning or coloring substrates, notably absorbent substrates, and particularly textile substrates. With the development of the electronic computer, such techniques have included the use of individually addressable dye applicators, under computer control, that are capable of dispensing a pre-determined, and in some cases, variable, quantity of a dye or liquid colorant to a specifically identified area or pixel on a substrate surface. Such techniques have been disclosed in, for example, U.S. Patent Nos. 4,116,626, 5,136, 520, 6,142,481, and 5,208,592, the teachings of which are hereby incorporated by reference.

In the devices and techniques described in the above-referenced U.S. patents, the pattern is defined in terms of pixels, and individual colorants, or

combinations of colorants, are assigned to each pixel in order to impart the desired color to that corresponding pixel or pixel-sized area on the substrate. The application of such colorants to specific pixels is achieved through the use of hundreds of individual dye applicators, mounted along the length of color bars that are positioned across the path of the moving substrate to be patterned. Each applicator in a given color bar is supplied with colorant from the same colorant reservoir, with different arrays being supplied from different reservoirs, typically containing different colorants. By generating applicator actuation instructions that accommodate the position of the applicator along the length of the color bar and the position of the color bar relative to the position of the target pixel on the moving substrate, any available colorant from any color bar may be applied to any pixel within the pattern area on the substrate, as may be required by the specific pattern being reproduced.

It is contemplated that other arrangements or techniques for systematically applying various colorants to a substrate surface in accordance with pattern data, such as, for example, having one or more sets of colorant applicators that are moved or indexed across the face of a relatively stationary or intermittently indexed substrate, may also employ the teachings herein.

The two basic primary backing constructions are woven polypropylene and non-woven polyester. Each material may have a variety of construction characteristics engineered for a specific end use. According to one potentially preferred embodiment, the preferred primary backing material 122 of FIG. 3A is 20 pick per inch, woven polypropylene, with needle punched nylon fleece.

According to another possibly preferred primary backing or tufting substrate embodiment, the primary backing 122 is a fused multi-component structure of a woven layer and a non-woven material needle punched through the woven layer, with at least a portion of the non-woven material being a low melt or binder material which when subjected to calendering (pressure and heat) melts

and fuses the non-woven and woven materials to form an enhanced stability primary backing. In accordance with one particular example, the woven layer is a woven polypropylene, the non-woven material is polyester, and the low melt material is low melt or co-polyester. In accordance with one very specific example, a ratio of 30% by weight low melt polyester fiber and 70% by weight polyester fiber is preferred. The weight percent range of low-melt or binder material may range from about 10% - 100% by weight of the non-woven, preferably 10% - 70%, most preferably 10% - 40%. The non-woven material may be any natural or synthetic fiber or blend thereof. For example, the non-woven may be polyester, recycled polyester, polypropylene, stabilized polypropylene, acrylic, nylon (polyamide), bi-component polyester, bi-component nylon, and blends or combinations thereof. If the non-woven material is a polypropylene or stabilized polypropylene, then no additional low melt material is needed.

The low melt material may be any synthetic material or fiber or blend that has a melting point below the calendering temperature and will adhere to the adjacent fibers. For example, the binder or low melt material may be polyester, co-polyester, polypropylene, polypropylene that has been chemically enhanced to raise the melt temperature, bi-component polyester, bi-component nylon, polyethylene, nylon, low melt nylon web, powder binder, chemical binder, extruded polypropylene web, and combinations or blends thereof. The woven material may be any natural or synthetic material or fiber or blend which serves as a tufting base in combination with the non-woven and low melt materials. For example, the woven material may be polypropylene, stabilized polypropylene, flat ribbon yarn (tape) polypropylene, polyester, polyester knitted scrim, polypropylene woven scrim, recycled polyester, and blends or combinations thereof.

In accordance with at least one example, the woven layer or material may have a pick range of from about 6 X 6 to 30 X 30, preferably from about 10 X 10 to

24 X 22, the non-woven material may have a weight range of about 1 – 6 oz./sq. yd., with a low melt or binder content of about 10 – 100% by weight. Such enhanced primary backing materials and production methods are described in above-mentioned patent application Serial No. 10/098,053
5 incorporated by reference herein.

In accordance with a particular exemplary embodiment, an enhanced primary backing having an overall thickness of about 0.017 inches and weight of about 5.03 oz./sq. yd. and a woven polypropylene tape layer (28 X 11 pick, 24 X 11 pick, 18 X 11 pick, or 13 X 11 pick), a non-woven material of blended, needled, and fused thereto polyester and low-melt polyester fibers (50% by weight natural polyester fibers 2-1/2 denier, 20% black polyester fibers 4 denier, and 30% low melt polyester 3 denier) is formed by placing the non-woven material over the woven layer, needle punching the non-woven material to the woven
10 layer (a small amount of the non-woven goes through the non-woven layer) and then calendering the composite on both sides (at a temperature of about 320°F top roller, 280°F bottom roller with roller pressures of about 85 pli) to fuse the non-woven material and woven layer. This fused, enhanced stability primary backing is less likely to fray when cut, does not harm the tufting yarn,
15 provides dimensional stability, better tuft lock, and may be used in carpet, broadloom, roll product, carpet tiles, area rugs, mats, and the like.
20

With regard to another embodiment, in the cut pile tufted carpet construction 110B of the present invention (FIG. 3B), the primary carpet fabric 112
25 preferably comprises a loop pile layer of pile-forming yarns tufted into a primary backing 122 as is well known and held in place by a pre-coat layer 124 of a bonding material such as latex, a hot melt adhesive or a urethane based adhesive. The pile forming yarns are subjected to a tip shearing or loop cutting operation to yield the cut pile yarns 121 and cut pile construction as shown. It
30 is contemplated that the pre-coat layer 124 may be applied to the primary backing 122 either in a preliminary processing step during formation of the

primary carpet fabric 112 or may be added in-line during formation of the cushioned carpet construction in a manner to be described further hereinafter in reference to FIG. 5A. The primary carpet fabric 112 may be steamed and/or heated after addition of the pre-coat layer 124 to facilitate subsequent printing
5 operations, such as direct or indirect jet dyeing or printing, and/or if desired to reduce stresses.

In accordance with a preferred embodiment of the present invention, the carpet yarn 120, 121, or 134 of carpet products 110A, 110B, and 110C, respectively,
10 is capable of being dyed or printed, such as jet dyed, flood dyed, rotary printed, or the like, by, for example, using a Millitron® jet dye machine marketed by Milliken & Company of LaGrange, Georgia, and can either be dyed in broadloom form or in tile form. Also, it is preferred that the complete carpet products or carpet tiles 110A, 110B and 110C of FIGS. 3A – 3C are capable of
15 being jet dyed, rotary printed, or the like in broadloom or tile form without destroying the carpet product or tile. For example, the carpet product or tile is preferably capable of withstanding the rigors of a jet dye process including dyeing, steaming, washing, drying, and the like. Consequently, the preferred carpet product or tile can withstand heat and humidity changes, and the yarn
20 can be dyed or printed. For example, the yarn may be white, light colored, such as off white or light beige, yarn dyed, solution dyed, or the like (see FIGS. 18A – 18D).

In the bonded carpet construction 110C of the present invention (FIG. 3C), the
25 primary carpet fabric 112 preferably comprises a plurality of cut pile yarns 134 implanted in an adhesive 136 such as a latex or hot melt adhesive which is laminated to a reinforcement or substrate layer 138 of a woven or non-woven material including fiberglass, nylon, polyester or polypropylene. It is contemplated that this substrate layer 138 may be pre-coated with latex or
30 other thermoplastic or thermoset materials or polymers to permit melting

adhesion with the cut pile yarns 134 upon the application of heat, thereby potentially reducing or eliminating the need for the adhesive 136.

The yarns 120, 121, and 134 may be either spun or filament yarns and are preferably formed from a polyamide polymer such as nylon 6 staple, nylon 6
5 filament, nylon 6,6 staple, or nylon 6,6 filament, available from companies like DuPont in Wilmington, Delaware or Solutia Fibers of St. Louis, Missouri, although other suitable natural or synthetic yarns or blends may likewise be employed as will be recognized by those of skill in the art. By way of example only and not limitation, other materials, which might be used, include polyester
10 staple or filament, polyethylene terephthalate (PET), and polybutylene terephthalate (PBT), polyolefins, such as polyethylene and polypropylene staple or filament, rayon, polyvinyl polymers such as polyacrylonitrile, wool, and blends thereof. A variety of deniers, plies, twist levels, air entanglement, and heatset characteristics can be used to construct the yarn. Potentially preferred
15 materials include nylon 6,6, filament, 1360 denier, 1 ply, no twist, no entanglement, and no heatset; nylon 6,6 , staple, 3.15 cotton count, 2 ply, twisted, and heat set; nylon 6,6, mixed filament with a total yarn denier of about 1360; nylon 6,6, mixed filament with a total yarn denier of about 2400; and nylon 6,6, spun fiber with a cotton count of about 1.8 cc, and 2 ply.

20 Although it is preferred that the yarn (or fiber) be a white or light color to facilitate injection dyeing or printing thereof, it is to be understood that the yarn may be of any nature and color such as solution dyed, naturally colored, and the like, and be adapted for dye injection printing, screen printing, transfer printing, graphics tufting, weaving, knitting, and/or the like.

25 According to one embodiment, the face weight of the yarn across the carpet will be less than about 20 ounces per square yard and will more preferably be not greater than about 15 ounces per square yard and will most preferably be not greater than about 12 ounces per square yard. It is believed that the use of no twist yarn of sufficient denier (in the range of about 1000d to 1400d) in non-

heatset form may facilitate the achievement of plush coverage even at such relatively low face weights due to bulking which takes place during subsequent dying and steaming operations. This is especially true of the low face weight loop pile construction described in previously mentioned published U.S. Patent
5 Application 20020034606.

According to another embodiment, the face weight of the yarns across the carpet will be in the range of about 20 to 60 ounces per square yard and will preferably be in the range of about 20 to 40 ounces per square yard.

10 In accordance with another exemplary embodiment, the primary carpet fabric has a modern residential face such as a frieze cut pile, a saxony cut pile, a loop pile, a Berber loop pile, or the like. This is especially preferred for residential carpet tiles or roll product (carpet tile material in long 3, 6, or 12 foot wide rolls that can be cut to length).

15

In the tufted product, the adhesive pre-coat 124 is preferably styrene butadiene rubber (SBR) or latex but other suitable materials such as styrene acrylate, polyvinyl chloride (PVC), ethylene vinyl acetate (EVA), acrylic, and hot melt adhesives such as bitumen, polyurethane, polyester, polyamide, EVA, or
20 asphalt based hot melt adhesives or blends thereof may likewise be utilized. As will be described further hereinafter, in the event that a hot melt adhesive is utilized, it is contemplated that a reinforcement material such as a fiberglass, nylon or polyester scrim woven or non-woven can be directly attached to form a composite laminate without the use of additional adhesive layers. Moreover, it
25 is contemplated that the adhesive pre-coat 124 may be entirely eliminated in the tufted product if the loop pile 120 is tufted in suitably stable relation to the primary backing 122 thereby yielding a composite structure as illustrated in FIGS. 6A and 6B.

It is contemplated that a carpet construction according to the present invention
30 including either a tufted or a bonded pile forming primary carpet fabric 112 may

be adjoined to an underlying sheet, mat or layer of reinforcement material 158 by one or more layers of a resilient polymeric adhesive material 160. The polymeric adhesive material 160 may be of either a thermoplastic or a thermosetting composition. Hot melt materials may be particularly preferred.

5 By way of example only and not limitation, useful hot melts may include bitumen, polyolefin-based thermoplastics. One potentially preferred hot melt material is polyolefin based thermoplastic. Useful thermosetting adhesives may include polyurethanes. It is contemplated that the total mass of hot melt adhesive utilized within both layers adjacent the reinforcement material will
10 preferably be in the range of about 20 to about 100 ounces per square yard of carpet and will more preferably be present at a level of about 35 to about 90 ounces per square yard of fabric.

The reinforcement material 158 preferably serves to enhance dimensional
15 stability across the carpet construction to substantially prevent the various layers from undergoing disproportionate dimensional change as the carpet construction is subjected to compressive forces during use and temperature or humidity changes during use and/or processing. The reinforcement material is preferably a sheet, mat or tissue incorporating multiple fiberglass (glass) fibers
20 entangled in a non-woven construction such as a 2 oz/yd² construction and may be held together by one or more binders such as an acrylic binder or modified acrylic binder. Such a construction is believed to provide dimensional stability and substantially uniform load bearing characteristics in all directions, which may be beneficial in some instances. Other materials as may be utilized
25 include glass scrim materials as well as woven or non-woven textile materials such as polyester or nylon. The reinforcement material 158 along with primary backing 122, and secondary backing 170 provide a carpet product, composite or tile which is stabilized and does not suffer from substantial bow, bias, skew, cup, or curl.

30 Although it is preferred that the carpet construction, roll product, or carpet tile of the present invention be dimensionally stable, it is also preferred that the

carpet construction have some flexibility, bendability, or rollability. For example, it is preferred that the carpet tile can bend or flex without breaking as an installer runs a tile up against a wall, bends it in the corner of the floor and wall, and cuts or trims it with a razor knife. Some flexibility not only helps with
5 installation of the tiles or construction, but also allows the product to go around corners, on stairs, up and down inclines, over flooring surface abnormalities, switch plates, wires, cables, and the like. Further, some flexibility or give allows the carpet composite to be rolled as 6' or 12' wide attached cushion broadloom (roll product) rather than cut into carpet tiles or prior to being cut
10 into tiles. Still further, some flexibility or give helps keep the tiles from popping out of place if installed without adhesives.

As illustrated in FIGS. 2, 3A, 3B and 3C, the polymeric adhesive material 160 is preferably disposed in covering relation on either side of the reinforcement
15 material 158. It is contemplated that such an embedded relation may be achieved by any number of manual or automated techniques. By way of example only, and not limitation, one such technique as may be employed is the direct application of the adhesive material 160 to each side of the reinforcement material 158 preceding insertion between the layer of cushioning
20 or foam 178 and the primary carpet fabric 112. Of course it is contemplated that such application may be conducted by any appropriate means as may be known to those of skill in the art including by way of example only and not limitation, spray coating, dip coating, roll coating, or manual application. However, notwithstanding the actual application mechanism as may be utilized,
25 it is contemplated that the adhesive material 160 will extend in covering relation away from each side of the reinforcement material 158. In this regard, it is contemplated that the adhesive material will preferably perform the dual functions of securing the reinforcement material 158 in place while simultaneously forming a bonding bridge between the underside of the primary
30 carpet fabric 112 and the upper surface of the cushion or foam layer 178.

According to a simplified processing arrangement as illustrated in FIG. 2, a preformed layer of, for example, polyurethane rebond foam or compressed particle foam 178 either with or without a backing layer 170 (FIGS. 3A and 3B) or a multi-component backing composite (FIGS. 10A-C) is conveyed along a travel path to a first mating calender 191 for joinder to, for example, a non-woven sheet of glass tissue, reinforcement material 158 which has been covered on its underside with a lower coating of hot melt polymeric adhesive material 160 at a first coating station 192. An additional upper coating of hot melt polymeric adhesive 160 is thereafter applied across the upper surface of the reinforcement material 158 (or the lower surface of carpet fabric 112) at a second coating station 193. Due to the high surface area and relatively porous nature of the non-woven reinforcement material, the polymeric adhesive 160 may extend at least partially through the reinforcement material while at the same time establishing a stable mechanical bond therewith. A preformed pile forming primary carpet fabric 112 as previously described is thereafter applied in overlying relation to the coated reinforcement material 158 at a second mating calender 194 such that the polymeric adhesive material 160 establishes a bond extending between the cushion or foam layer 178 and the underside of the primary carpet fabric 112. The resulting construction may be heated or cured at 198 and is substantially as illustrated in FIGS. 3A, 3B or 3C (or 6A - 9B, 11A - 12C, 14A - 14B, or 37). In accordance with a preferred embodiment, the backing 170 is adhered to foam 178 by flame lamination as shown in FIG. 31 (the felt is flame laminated to one side of the rebond foam sheet or layer). By adding another coating station and mating calendar, for example, upstream of foam 178 being joined to reinforcement material 158, another layer of adhesive (1071, 1371, hot melt tie-coat) can be used to attach a backing material or composite to the bottom of the foam 178 (FIGS. 10A - 10C, 13A - 13C, 23, 41, 42, or 43).

As described in U.S. Patent Nos. 5,312,888; 5,817,703; 5,880,165; and 6,136,870 (hereby incorporated by reference) rebond foam or rebond polyurethane foam is known in the art of isocyanate-based polymeric foams.

Specifically, it is known to mix pieces of foam with a binder which serves to bond the pieces to one another. Rebonding technology has been used for a number of years to recycle, inter alia, polyurethane foams. Generally, a large chip or chunk size, low density, non-uniform density, rather frangible, thick, rebonded polyurethane foam product has been used as a separate, relatively thick, broadloom carpet underlayment or pad, and in specific seating and cushioning applications. Given the non-uniform and fragile nature as well as prior applications for such rebond foam, it is not surprising that these foams have not been used in cushion back carpet tile or preformed, attached cushion broadloom applications.

Polymer foams, particularly flexible polymer foams, can be fabricated into sheets, pads, blocks, or objects having useful shapes. For example, flexible foams can be molded or machined into shapes useful for preparing automobile seats, bedding, and the like. Flexible foams can be used in carpet and furniture production, as well as in the manufacture of toys and the like.

However, in processes for preparing foam sheets, pads, blocks, or shaped polymer foams, waste foam can be produced. The waste foam can be from the fabricating process and represent the area/volume of the foam removed from the starting block stock (or loaf) such as the crust to form the shaped foam object. The waste foam can also be the crust, trimmings, scraps, or off-specification products which are occasionally produced in some fabricating processes.

Whatever its source, waste foam production is usually undesirable. The waste foam can represent materials which must be discarded and not sold. In some areas, landfill space has become scarce and the cost of disposing of waste foam has become very high.

There have been efforts to recycle or re-use waste foam production, particularly waste, trim and scrap from the production of flexible foams. Flexible polyurethane foam scrap can be chopped or chipped and then coated with a binder consisting of a polyisocyanate prepolymer having isocyanate functionality and a catalyst. The coated, chopped foam is compressed and then treated with steam to cure the binder to form a rebond foam sheet or other shape.

In another process for recycling or using flexible polyurethane foam waste, the flexible foam waste is cryogenically ground and blended back into the formulation used to prepare it. The ground flexible foam can be used at a level of about 20 percent within the polyol component of the polyurethane foam formulation.

In accordance with the present invention, it is preferred to use at least about 10-90% recycled foam or rebond foam containing at least about 10-100% recycled foam chips, chunks, pieces, grounds, particles, or the like and a binder, adhesive, or prepolymer (and one or more additives) to produce a cushioned carpet composite or carpet tile having at least about 10-100% recycled foam or cushion content (especially post industrial reclaimed foam or cushion content) in the foam or cushion layer thereof.

With reference to FIGS. 28 – 30 of the drawings and in accordance with one embodiment of the present invention, it is preferred to use a small chip size, relatively high density, sturdy, thin rebond foam material formed by a process of shredding or grinding foam materials such as foam scrap or waste in a foam shredder to form foam chips, crumbs, or particles which are fed to one or more storage hoppers (different densities, colors, or types of foam chips can be stored in respective hoppers). The foam chips are fed from the hoppers to a blend tank wherein different colors, densities, and/or types of chips are blended and mixed with one or more binders, adhesives, prepolymers, and/or

additives from one or more reactors or tanks to form a blended, mixed, chip and binder slurry (for example about 85% chips, 15% binder). The slurry is fed to a large compression cylinder or vessel, is compressed (for example 2:1 – 4:1) and treated with heat and steam to set or cure the rebond foam in its
5 compressed state (compressed particle foam). After cooling, the rebond foam log or block is removed from the cylinder and mounted in a peeling or slicing apparatus having a band knife or other blade or device for cutting, slitting or peeling a rebond foam sheet or pad from the exterior of the log or roll.

10 With reference to FIGS. 31, 32 and 38, the rebond foam sheet may have one or more materials laminated to the top and/or bottom surface thereof (e.g. glass mat and/or felt) to form a foam or cushion composite which is laminated or attached to at least a carpet or tile material or face to form a carpet composite or product.

15 In accordance with the present invention, it is preferred to use a rebond foam having a backing, such as a scrim, woven or non-woven material on at least one surface.

20 In accordance with the present invention, it is preferred to use a rebond foam or polyurethane rebond foam with a density of about 1 to 25 lbs per cubic foot, more preferably about 3-22 lbs. per cubic foot, still more preferably 6-13 lbs. per cubic foot, and most preferably 8 – 12 lbs. per cubic foot; a thickness of about 1-30 mm, more preferably about 2 – 21 mm, and most preferably about
25 2 – 12 mm; a rebond chip size (uncompressed chip size) of about 2-25 mm, more preferably about 5-15 mm, most preferably about 7-10 mm round or square hole mesh; and, a backing material or backing composite on at least one side thereof.

By way of another example, as illustrated in FIG. 4, it is contemplated that a
30 preformed reinforcement material composite 159 including a pre-applied adhesive such as a hot melt coating on one or both sides may be laminated to

a preformed rebond foam layer 178 and primary carpet fabric 112 by heating the upper and lower surfaces of the composite 159 with heating elements 195 such as a flame 196 or the like and pressing the three preformed materials 112, 159, 178 together. If desired, heat may be applied to the resulting
5 construction or composite at 197 to form a product such as shown in, for example, FIGS. 3A – 3C, 6A – 14B, and 23).

As previously indicated, due to the relatively porous nature of the reinforcement material 158, it is contemplated that the hot melt adhesive 160 may be pressed
10 through such material. Thus, it is contemplated that the first coating station 192 in FIG. 2 may be replaced with a forced spray, roll or the like if desired to deposit hot melt adhesive 160 across both sides of the reinforcement material 158 prior to lamination.

15 While the carpet construction according to the present invention may be formed utilizing the eloquently simple assembly or lamination processes as illustrated and described above in relation to FIGS. 2, 4, 31, 32, and 38, it is contemplated that a degree of efficiency may be realized by utilizing in-situ or in-line processes for formation thereof. Referring to FIGS. 5, 17A, and 17B
20 according to one exemplary in-line process, a primary carpet fabric 112, with or without a pre-coat underlayer, is conveyed by means of a plurality of rolls through an accumulator 150 to a reinforcement bonding unit 155. Simultaneously with the conveyance of the primary carpet fabric 112 to the reinforcement bonding unit 155, a sheet of reinforcement material 158 is
25 likewise conveyed to the reinforcement bonding unit 155. The reinforcement material 158 is preferably fiberglass non-woven material such as a 2.0 oz/yd² fiberglass containing a urea formaldehyde binder, acrylic binder or the like although alternative materials may include by way of example only, woven glass, woven polyester, non-woven glass, and non-woven polyester.

At the reinforcement bonding unit 155, an adhesive material 160 such as a hot melt polymeric adhesive is preferably applied to at least the top surface of the reinforcement material 158 by means of a film coater or other such unit as are well known. The coated reinforcement material 158 and the primary carpet fabric 112 are thereafter preferably passed in mating relation between joining members such as rolls 163, 165, thereby bonding the coated reinforcement material 158 to the underside of the primary carpet fabric 112. That is, the reinforcement material 158 is bonded on the side of the primary carpet fabric 112 from which the pile forming yarns do not project. The bonding of the reinforcement material 158 to the underside of the primary carpet fabric produces a stabilized preliminary composite 166 to the underside of which another coating of adhesive material 160 is applied at a coating station 179 to substantially enclose the reinforcement material 158 within such adhesive material and to form a stabilized intermediate composite 167 which is thereafter laid into an adhesive, hotmelt, or a polyurethane-forming composition layer 180 on top of a preformed rebond foam layer 178 or directly onto the bare top surface of the foam layer 178 as described below.

Although the reinforcement bonding unit 155 is illustrated as incorporating a film coater, and the coating station 179 is illustrated as incorporating a vertical application roll, it is to be understood that any number of alternative means such as spray coaters, blade coaters, dip coaters, or the like may also be utilized. By way of example only, and not limitation several alternative means for the application of adhesive 160 are disclosed in U.S. Pat. No. 4,576,665 to Machell.

According to a potentially preferred practice, while the preliminary composite 166 is being formed, a preformed rebond foam layer, composite, or sheet 178 is passed through a polymer application unit 175 which preferably includes a polymer discharge unit 176 and a doctor blade 177. The foam layer 178 is

coated with an adhesive or polymer 180 such as a polyurethane-forming composition as disclosed more fully below.

In one preferred embodiment, the preformed foam layer 178 may include a
5 backing material 170 such as woven or non-woven about 10% to 100%
polyester/90%-0% polypropylene, preferably about 50% polyester/ 50%
polypropylene non-woven fibrous material or felt such as is available from
Synthetic Industries of Ringold, Georgia and which may contain a colorant or
10 binder such as acrylic binder. While this represents the backing material of
preference, it is to be understood that any number of alternative compositions
or composites may likewise be utilized as dictated by requirements regarding
shrinkage and installation. The commonly used secondary backing materials
include non-woven polyester, non-woven polyester and polypropylene blends,
or woven polypropylene. By way of example only, in instances where very little
15 or no shrinkage may be tolerated, the backing material may be up to 100%
polyester. Further, while a non-woven backing material may be preferred, it is
contemplated that either woven or non-woven constructions may be utilized as
can materials other than the polyester/polypropylene mix such as acrylic, nylon,
fiberglass, and the like.

20 As indicated, in the preferred practice, the polymer application unit 175 applies
a deposit of a polymer 180 on the top of the cushion or foam layer 178 (FIGS.
5, 5A, 17A, 17B) after which the height of the polymer layer is doctored to a
desired level. In the preferred practice, the polymer applied is a polyurethane-
25 forming composition based on a so-called soft segment pre-polymer of MDI
(diphenylmethane diisocyanate) or an MDI derivative. The polyurethane-
forming composition also preferably incorporates a silicone surfactant to
improve both the frothability and stability of the polyurethane layer or "puddle"
180 which is spread across the surface of the preformed foam layer 178.

30 The foam density of the preformed foam layer 178 is preferably in the range of
about 1 – 25 lbs. per cubic foot, preferably about 6 to about 20 lbs. per cubic

foot with a thickness of about 0.04 to about 1.5 inches, preferably about 0.04 to about 0.5 inches. According to one potentially preferred arrangement, the foam density is about 16 lbs. per cubic foot or less with a thickness of about 0.06 inches although it is contemplated that such levels may vary greatly
5 depending upon desired product characteristics.

It is contemplated that the material forming the layer 180 and the foam or rebond cushion 178 may be the subject of a broad range of alternatives. By way of example only and not limitation, at least five options or examples of the
10 layer 180 and/or foam cushion material 178 are believed to be viable to yield commercially acceptable foam products using virgin polyurethane and/or recycled polyurethane chips, chunks, granules, etc.

1. Use of standard filled Polyurethane system as the virgin and/or rebond polyurethane. One polyurethane foam contains 110 parts of filler and is
15 applied at a density of about 15 lbs/cu. ft. If the thickness is in the range of .04 - .12 and we determine polymer weight only, using the density and filler levels above, the weight range of the polymer would be 4.32 oz/sq yd to 12.96 oz/sq yd. The density can be lowered by lowering the amount of filler.
20
2. A second option which would also work for the virgin and/or rebond polyurethane would be to increase the filler levels to 190 and reduce the density to 13 lbs/cu. ft. At the same thickness limits the polymer weights would then be 2.72 – 8.24 oz/sq. yd.
25
3. A third option for the virgin and/or rebond polyurethane would be to use an unfilled polyurethane (Prime urethane) system. High densities such as above are not possible with prime however, they perform because of the wall structure and the fact that no filler is present. If we consider a
30 prime to be at 6 lbs/cu. ft. applied at the thickness limits above the polymer weight would be 2.88 – 8.64 oz/sq. yd.

4. A fourth option for the virgin and/or rebond polyurethane is also possible. Textile Rubber has a polyurethane system available under the trade designation KANGAHIDE which has only 15 parts of a filler material and is applied at 6 – 9 lbs/cu. ft. density, if a polymer calculation is again made at the described thickness limits it would be 4.3 – 13.02 oz/sq. yd.

5. A fifth option is to use a medium density or hybrid foam formed of mechanically frothed and chemically blown polyurethane foams. Such a mechanically frothed and chemically blown polyurethane foam is described, for example, in U.S. Patent No. 6,372,810 hereby incorporated by reference herein.

Although the above examples have to do with polyurethane, a water based foam system can also be used. For example, the foam may be an SBR foam. Although a polyurethane rebond foam or compressed particle foam (formed of compressible particles, chips, crumbs, etc.) is preferred, it is understood that other compressible particles made from other foams (open cell, closed cell) or materials such as SBR foam, PVC foam, polyethylene foam, cork, rubber, crumb rubber, and/or the like may be used.

A potentially preferred polyurethane-forming composition for use as the polymer 180 and the virgin and/or rebond polyurethane chips in the rebond foam 178 of the present invention is disclosed in U.S. Pat. No. 5,104,693 to Jenkins the teachings of which are incorporated herein by reference. Specifically, the preferred polyurethane-forming composition which is used as the virgin and/or rebond polyurethane in the rebond foam and/or which is applied across the surface of the foam layer 178 includes:

A. At least one isocyanate-reactive material having an average equivalent weight of about 1000 to about 5000;

- B. An effective amount of blowing agent; and
- C. A polyisocyanate in an amount to provide an isocyanate index of
5 between about 90 and about 130, wherein at least 30 percent by weight
of such polyisocyanate is a soft segment pre-polymer reaction product
of a stoichiometric excess of diphenylmethane diisocyanate (MDI) or a
derivative thereof and an isocyanate-reactive organic polymer having an
equivalent weight of from about 500 to about 5,000 and wherein the
10 prepolymer has an NCO content of about 10 to about 30 percent by
weight.

The polyurethane-forming composition also preferably contains a silicone
surfactant to improve frothability and stability in the form of an Organo-silicone
15 polymer such as are disclosed generally in U.S. Pat. No. 4,022,941 to Prokai et
al. the teachings of which are incorporated herein by reference. Specifically,
the preferred surfactant is preferably a linear siloxane-polyoxyalkylene (AB)
block copolymer and specifically a polyalkyleneoxidemethylsiloxane copolymer.
One such silicone surfactant which is particularly useful is available under the
20 trade designation L-5614 from OSI Specialties, Inc. whose business address is
believed to be 6525 Corners Parkway, Suite 311, Norcross, Ga. 30092.

A sufficient level of the silicone surfactant is used to stabilize the cells of the
foaming reaction mixture until curing occurs to allow the preliminary composite
25 166 to be laid into the uncured polyurethane-forming composition puddle 180
without destabilizing the layer of such polyurethane-forming composition
disposed across the surface of the foam layer 178. In general, the silicone
surfactants are preferably used in amounts ranging from about 0.01 to about 2
parts per hundred parts by weight of component (A) and more preferably from
30 about 0.35 parts to about 1.0 parts by weight of component (A) and most

preferably from about 0.4 to 0.75 parts per hundred parts by weight of component (A).

As previously indicated, after disposition of the polyurethane-forming polymer
5 180 across the foam layer 178 the layer or "puddle" of the polymer deposited is preferably doctored to a pre-determined height by means of a doctor blade located at the polymer application unit 175. While a simple mechanical doctor blade is preferred, alternative equivalent means such as an air knife, spray coating, roller coating, or the like may also be used. Such an air knife is
10 disclosed, for example, in U.S. Pat. No. 4,512,831 to Tillotson (incorporated by reference).

Although it is preferred for the foam layer 178 to be formed of a rebond foam, more preferably a polyurethane rebond foam, it is contemplated that a virgin or
15 prime polyurethane or filled polyurethane foam may be used. For example, a residential tile may be formed in an in-situ or in-line process using a virgin or prime filled polyurethane foam such as described in previously mentioned U.S. Patent Nos. 6,203,881 or 6,372,810.

20 In one embodiment of the present invention, the intermediate composite 167 of the primary carpet fabric 112, which is preferably joined to the coated reinforcement material 158, can be laid directly into the polyurethane-forming composition 180 immediately after it is doctored to the appropriate level without any need to significantly heat either the intermediate composite 167 or the
25 polyurethane-forming composition 180. Accordingly, the intermediate composite 167 and the foam layer 178 with the applied polyurethane-forming composition 180 may be simultaneously delivered at room temperature to a mating roll 181 immediately following the application and doctoring of the polyurethane-forming composition. As will be appreciated, the use of rebond
30 foam 178 reduces cost and produces a composite having a high recycled foam content. In the preferred process, at least one side of the intermediate

composite 167 may be slightly preheated to improve operating control during lamination and curing but such preheat is not essential to formation of the desired product.

- 5 In the illustrated embodiment of the in-line or in-situ carpet construction, the process described above results in the adhesive material 160 being laid adjacent to and extending away from the layer of cushioning foam 178 to the underside of the primary carpet fabric 112 with the layer of reinforcement material being embedded in intimate relation within the adhesive material 160
10 at a location intermediate the cushioning foam and the primary carpet fabric 112. Thus, at least a portion of the adhesive material 160 extends away from either side of the reinforcement layer 158.

Once the intermediate composite 167 has been laid into the polyurethane-forming composition 180, the resulting final composite 168 may be heated or
15 cured in a heating unit 182 by means of conduction, radiant, or convection heaters as are well known in the art. Contact conduction heaters may be preferred. Such heating may be carried out at a temperature of between about 250°F and about 325°F for between about 2 minutes and 8 minutes.

20 Following the heat curing operation, the final cushioned carpet composite 168 that is formed may be passed over a unidirectional heat source 185 such as a plate heater or roll heater at about 400°F to fuse any outstanding fibers on the backing material 170 into a sooth surface. The carpet composite 110A, 110B,
25 110C (FIGS. 3A-3C) that is formed will thereafter be cooled, rolled, cut, sliced, or the like. When making carpet tiles, it is preferred that it be cut into carpet tiles almost immediately (rather than rolled) to avoid any undesired cupping or curl. After the carpet tiles are cut from the composite 168, they are printed or dyed, washed, fixed, dried, cooled, stacked, packaged, stored, and/or shipped
30 to the customer.

It will be appreciated that a number of alternative practices may be incorporated into the present invention yielding a finished construction wherein the reinforcement layer 158 is enclosed within the adhesive material 160. In accordance with another example of the present invention, the primary carpet

5 112 is a loop pile tufted carpet formed by tufting, for example, a non-heatset yarn through the primary backing, then washing, steaming, drying, and injection or jet dying thereon a, preferably, monolithic or orientation independent design, color, or pattern to form, for example, a 12 foot wide primary carpet precursor of loop pile 120 and primary backing 122. By using a non-heatset yarn, and

10 originally tufting the yarn at a rather long loop length, the washing, steaming, drying, and dying steps shrink the yarn to form smaller, tighter loops and provide a denser surface to the primary carpet precursor. Next, this primary carpet precursor is split in half and rolled to form, two separate six foot wide rolls 115 of split primary carpet precursor 113 (FIG. 5A).

15 Next, one roll 115 of the split primary carpet precursor 113 is used as the initial carpet feed in the apparatus of Figure 5A. A latex pre-coat or hot melt adhesive coat 124 is added to the back of the primary carpet precursor 113 to form a primary carpet fabric 112 in the upper run of the apparatus of FIG. 5A

20 downstream of the accumulator 150 and upstream of the reinforcement bonding unit 155. For example, a thin layer of latex pre-coat 119 is applied to the back of the primary carpet precursor 113 using a coating roller 117. The remainder of the process proceeds as described above in relation to FIG. 5.

25 In accordance with yet another potential practice and as shown in FIG. 5B, it is contemplated that the cushioning foam or rebond foam 178 may be delivered in a preformed condition to the mating roll 181 for bonding to the intermediate composite 167 which may be formed as previously described in relation to FIGS. 5 and 5A. As will be appreciated, such a preformed cushioning foam

30 178 may be formed with the desired backing material 170 or multi-component backing composite (FIGS. 10A-C and 13A-C) disposed across its underside.

Also, the upper surface of the preformed foam layer 178 may be heated by, for example, heater 195 and flame 196 to heat or melt the upper surface and enhance the attachment of composite 167 to foam layer 178.

- 5 Further, roll applicator 179 of FIG. 5B may be eliminated and heater 195 and flame 196 can be used to cause the foam layer 178 to adhere to the reinforcement material 158 of composite 166.

- 10 Similarly, the polymer application unit 175 or roll applicator 179 of FIGS. 5 and 5A may be eliminated and the composite 166 or 167 may be joined to the foam layer 178 by the adhesive 160 or polymer 180.

- 15 Also, reinforcement material 158 or composite 159 and its associated coating or bonding unit may be eliminated from the process of FIGS. 2, 4, 5, 5A, and/or 5B when an additional reinforcement layer or material is not needed or desired or when the reinforcement material is already attached to or part of the carpet and/or foam or cushion (FIGS. 15A, 15B, 16A, 19A, 19B, 20, 21, 22, 24, 25, and 36).

- 20 It is contemplated that the apparatus of the present invention may include the entire assembly process from tufting the yarn in the primary backing, dying the tufted yarn, latex pre-coating the back of the primary backing, hot-melt coating the fiberglass reinforcing material, forming the cushion or foam with or without the felt secondary backing, laminating the primary carpet, reinforcing
25 fiberglass, and foam or cushioning layer, heating or curing the laminate, and cutting the resultant carpet composite into carpet tiles, runners, area rugs, or the like, dying or printing the cut tiles, adding adhesive or tack to the back of each tile, and packaging the resulting products. Also, it is contemplated that in accordance with the present invention the process may be broken down into its
30 respective steps and done in a batch rather than a continuous mode. For example, the primary carpet may be formed in one operation and placed on

rolls or folded into bins. The cushion, backing or foam layer may be formed in a separate operation and placed on rolls or folded into bins. The preformed primary carpet and cushion backing may be joined by a mating unit using an adhesive, hot melt, hot melt with reinforcing layer, or the like (FIGS. 2, 4, 38).

5 Also, the hot melt and reinforcing material composite may be preformed and placed on rolls or folded into bins. Still further, the preliminary composite 166, intermediate composite 167, or final composite 168 (FIGS. 5, 5A, 5B) may be preformed and placed on rolls or folded into bins.

10 As will be appreciated, there exist a substantial number of alternative embodiments and configurations for foam backed or cushioned carpeting or carpet tile that may incorporate features of the present invention. As illustrated in FIGS. 6A and 6B, wherein like components to those previously described are designated by corresponding reference numerals within a 600 series, it is
15 contemplated that tufted loop pile and tufted cut pile constructions 610A and 610B include a first layer of hot melt adhesive 660 which extends away from the primary backing 622 and into contact with a sheet of reinforcement material 658 such as the non-woven glass or scrim material previously described. Thus, the first layer of hot melt adhesive 660 serves the function of securing
20 the tufts 620, 621 in place relative to the primary backing 622 thereby avoiding the need to utilize a separate latex or hot melt pre-coat. A second layer of hot melt adhesive 660 extends away from the reinforcement material 658 into contacting relation with the foam cushion or rebond material 678 to establish a bonding relation between the primary carpet 612 and the foam cushion or
25 rebond material 678. Accordingly, a single adhesive layer extends between the upper surface of the reinforcement material 658 and the underside of the primary backing 622. By way of example only and not limitation, it is contemplated that such a construction may be realized as shown in FIGS. 2, 4, 5, or 5B or by eliminating the latex pre-coat 119 in FIG. 5A, but otherwise
30 carrying out the operation in the manner as previously described.

As illustrated in FIGS. 7A, 7B and 7C wherein like components to those previously described are designated by corresponding reference numerals within a 700 series, it is contemplated that tufted loop pile construction 710A, tufted cut pile construction 710B, and bonded cut pile construction 710C
5 include a first layer of resilient adhesive 760 extending away from the upper surface of a layer of reinforcement material 758 and which may be of a different character from a second layer of resilient adhesive 760' extending away from the lower surface of the reinforcement material. In all other respects, the configuration is substantially as illustrated and described in
10 relation to FIGS 3A, 3B and 3C or 6A and 6B with assembly being carried out by any of the techniques illustrated and previously described in relation to FIGS. 2, 4 and 5A-C. By way of example only and not limitation, in the event that the reinforcement material 758 is disposed between two different adhesives, it is contemplated that the adhesive 760 extending away from the
15 upper surface of the reinforcement material 758 may be, for example, hotmelt, while the adhesive 760' extending away from the lower surface of the reinforcement material 758 may be, for example, polyurethane forming composition, a low melt powder, low melt fibers, a low melt film, or the like. Also, adhesive 760 or 760' of FIGS. 7A and 7B may be multiple layers of the
20 same adhesive.

In FIGS. 8A and 8B wherein like components to those previously described are designated by corresponding reference numerals within an 800 series, there are illustrated yet additional potential embodiments of the present invention. In
25 such embodiments, tufted loop pile construction 810A and tufted cut pile construction 810B include a layer of reinforcement material 858 disposed between a first layer of latex adhesive 824 extending away from the upper side of the reinforcement material 858 and a second layer of latex adhesive 824 extending away from the lower side of the reinforcement material 858. Thus,
30 latex extends substantially between the upper surface of the cushion or foam 878 and the primary backing 822 with the layer of reinforcement material 858

disposed within such latex at an intermediate position. Such latex is preferably a carboxilated styrene butadiene rubber (SBR) latex. Of course it is also contemplated that similar constructions utilizing other adhesives such as Polyvinyl chloride (PVC), ethylene vinyl acetate (EVA), and acrylics as well as
5 hot melts or polyurethanes as previously described may be useful.

As previously indicated, it is contemplated that additional stability may be applied to the construction of the present invention by incorporating stabilizing elements in intimate relation to the primary backing of a tufted primary carpet.

10 Exemplary embodiments incorporating such configuration are illustrated in FIGS. 9A and 9B wherein like components to those previously described are designated by corresponding reference numerals within a 900 series. As illustrated therein, tufted loop pile construction 910A and tufted cut pile construction 910B include pile forming yarns 920, 921 tufted through a primary
15 backing 922 which incorporates therein a non-woven or scrim primary backing stabilizing layer 923. The primary backing stabilizing layer 923 may be adjoined to the primary backing 922 by a needling or calendering operation. In addition, point bonding may be achieved between the structures by incorporating heat activated adhesive fibers within the non-woven construction.

20 In the event that a construction incorporating a primary backing stabilizing layer is utilized, it is contemplated that the pre-coat 924 and/or the reinforcement material 958 may be substantially reduced or even eliminated entirely if desired due to the stability imparted to the enhanced primary backing 922, 923.

25 In FIGS. 10A-C there are illustrated several potential preferred embodiments 1010A, 1010B, 1010C wherein like components to those previously described are designated by corresponding reference numerals within a 1000 series. As will be appreciated, such embodiments correspond substantially to those illustrated and described in relation to FIGS. 3A-C with the exception that the
30 backing material 1070 is not in direct contacting relation to the foam cushion or rebond foam 1078. Rather, the backing is bonded or laminated to the foam by

an adhesive or a multi-component composite backing is applied across the underside of the foam cushion 1078. According to the relatively simple embodiment illustrated, such composite backing 1070, 1071 includes a relatively thin layer of adhesive such as a hot melt or other resilient adhesive

5 1071 extending in bonding relation between the underside of the foam cushion 1078 and the backing material 1070 of woven or non-woven construction as previously described. The thickness of such adhesive 1071 is preferably not greater than about 40 oz/yd² and will most preferably be about 20 oz/yd² or less. As will be appreciated, it is contemplated that the multi-component

10 composite may include virtually any number of layers of different materials including by way of example only and not limitation, release layers, additional adhesive layers, and/or stabilizing layers in various arrangements as may be deemed useful. Moreover, while the multi-component composite backing has been illustrated in relation to carpet constructions substantially corresponding

15 to those illustrated and described in FIGS. 3A-C, it is to be understood that such composite backings may likewise be used in any number of other constructions including, for example, those of FIGS. 6A-B, 7A-C, 8A-B, or 9A-B, but not limited to those previously described hereinabove. For example, another coating station may be added upstream of foam 178 in FIG. 2 to attach

20 backing 170 to foam 178 with adhesive 160.

Yet another set of alternative configurations are illustrated in FIGS. 11A-C wherein like components to those previously described are designated by corresponding reference numerals within an 1100 series. As illustrated, these

25 embodiments 1110A, 1110B, 1110C correspond substantially with those of FIGS. 3A-C except that the foam cushion or rebond foam 1178 is substantially free of any supplemental backing. As will be appreciated, while the absence of a supplemental backing has been illustrated in relation to carpet constructions substantially corresponding to those illustrated and described in FIGS. 3A-C, it

30 is to be understood that such practices may likewise be used in any number of

other constructions including, for example, those of FIGS. 6A-B, 7A-C, 8A-B, 9A-B, or 10A-C but not limited to those previously described.

5 In FIGS. 12A-C, there are illustrated several alternative embodiments wherein like components to those previously described are designated by
corresponding reference numerals within a 1200 series. As will be appreciated, such embodiments 1210A, 1210B, 1210C correspond
substantially to those illustrated and described in relation to FIGS. 3A-C with
the exception that the backing material 1270 includes a thin layer of tacky
10 releasable adhesive 1287 and an access layer 1289 disposed across the undersurface. The thin access layer 1289 of paper or other suitable film or material is disposed in peel-away relation below the releasable adhesive so as
to permit an installer to expose the releasable adhesive during installation. As
will be appreciated, such releasable or peel and stick adhesive provides a
15 relatively weak bond in tension while providing a stronger bond in shear such that a carpet element such as a carpet tile can be pulled away from an underlying surface but will be substantially resistant to undesired sliding movement. The thickness of such releasable adhesive is preferably not
greater than about 20 oz/yd² and will most preferably be about 5 oz/yd² or less.

20 As will be appreciated, while the releasable adhesive backing has been illustrated in relation to carpet constructions substantially corresponding to those illustrated and described in FIGS. 3A-C, it is to be understood that adhesive backings may likewise be used in any number of other constructions
25 including but not limited to the constructions of FIGS. 6A - B, 7A - C, 8A - B, and 9A - B as well as those having bare foam undersides in FIGS. 11A-C.

As shown in FIGS. 13A-C wherein like components to those previously described are designated by corresponding reference numerals within a 1300
30 series, it is contemplated that carpet constructions 1310A, 1310B, 1310C include a releasable adhesive backing 1387, and access layer 1389 may be

incorporated as the lower surface elements of a multi-component composite backing 1370, 1371 as previously described in relation to FIGS. 10A-C.

Alternative examples of a tufted carpet product 1400 is illustrated in FIG. 14A
5 and of a bonded carpet product 1410 is illustrated in FIG. 14B. In the tufted carpet of Figure 14A, a primary carpet fabric 1412 is embedded in an adhesive layer 1416 in which is embedded a layer of glass scrim 1418. A rebond foam base composite 1419 is likewise adhesively bonded to the adhesive layer 1416. In the tufted carpet illustrated in FIG. 14A, the primary carpet fabric 1412
10 includes a loop pile layer 1420 tufted through a primary backing 1422 by a conventional tufting process and held in place by a pre-coat backing layer of latex 1424 or other appropriate adhesives including a hot melt adhesive or the like. The rebond foam base composite 1419 of the tufted carpet product 1400 includes a backing layer 1426 molded, bonded, or laminated to a layer of urethane rebond foam 1428 as illustrated.
15

The bonded carpet product 1410 (FIG. 14B) employs the same type of rebond foam base composite 1419 adhesively bonded by adhesive laminate layer 1416. However, the primary bonded carpet fabric 1412 has somewhat different
20 components from that of the tufted product in that it has cut pile yarns 1434 implanted in a PVC, latex, or hot melt adhesive 1436 and has a substrate or reinforcement layer 1438.

It is preferred that the backing layer or material 1426 be laminated to the foam
25 1428 by flame lamination (FIG. 31). Alternatively, it may be attached by one or more adhesives (FIGS. 10A – 10C).

Alternative examples of tufted carpet products 1500 and 1511 are illustrated in FIGS. 15A and 15C and of a bonded carpet product 1510 is illustrated in FIG.
30 15B. In the tufted carpet product 1500 of Figure 15A, a primary carpet fabric 1512 is attached to an adhesive layer 1560. A rebond foam base composite is

likewise adhesively bonded to the adhesive layer 1560. In the loop pile tufted carpet illustrated in FIG. 15A, the primary carpet fabric 1512 includes a loop pile layer 1520 tufted through a primary backing 1522 by a conventional tufting process and held in place by a pre-coat backing layer of latex 1524 or other appropriate adhesives including a hot melt adhesive or the like. The rebond foam base composite of the tufted carpet product 1500 includes a reinforcement layer 1558 and a backing layer 1570 molded, bonded, or laminated to respective sides of a layer of urethane rebond foam 1528 (FIGS. 31 and 32). In the cut pile tufted carpet illustrated in FIG. 15C, the primary carpet fabric 1512 includes a cut pile layer 1521 tufted through a primary backing 1522 and held in place by a pre-coat or tuft lock layer 1524.

In at least one bonded carpet construction of the present invention (FIG. 15B), the primary carpet fabric 1512 preferably comprises a plurality of cut pile yarns 1534 implanted in a latex or hot melt adhesive 1536 which is laminated to a reinforcement or substrate layer 1538. It is contemplated that this substrate layer 1538 may be pre-coated with latex or other thermoplastic polymers to permit melting adhesion with the cut pile yarns 1534 upon the application of heat, thereby potentially reducing or eliminating the need for the latex or hot melt adhesive 1536.

An adhesive 1560 (FIGS. 15A, 15B, 15C) such as a hot melt adhesive is preferably applied to the carpet 1512 or the reinforcement material 1558 by means of a film coater or other such unit as are well known.

In the illustrated embodiments of FIGS. 15A, 15B, and 15C, the layer of reinforcement material 1558 is adjacent to and preferably at least partially embedded in the layer of rebond polyurethane 1578. That is, the reinforcement material 1558 is in intimate contact with the polyurethane 1578 such that the polymer material will hold the reinforcement in place (FIG. 31).

It will be appreciated that a number of alternative practices may be incorporated into the present invention yielding slightly different products. By way of example only, the reinforcement material may be left completely out of the process thereby making the use of at least one adhesive application apparatus or adhesive layer completely unnecessary. In such instances, the primary carpet fabric may be positioned adjacent the rebond cushion or cushion composite thereby yielding a composite structure as illustrated in FIGS. 16A, 16B, 26, and 27 with the polyurethane rebond foam 1678 immediately adjacent to the primary carpet fabric 1612. It is preferred that the rebond foam be laminated to the carpet by flame lamination (FIG. 31).

In accordance with another embodiment, a hot melt or adhesive layer may be used to mate the primary carpet to the cushion layer with or without the reinforcement material (FIGS. 19A, 19B, 22, 23, 24, 25, 42, 43, 44, 45).

In yet another alternative, the cushion backing may have an adhesive quick release backing attached to the face to which the polyurethane-forming composition is not applied. Moreover, it is contemplated that in some instances the backing might be completely eliminated such that the polyurethane rebond cushion would directly contact the flooring (FIGS. 25, 26, 27).

Also, the carpet tiles of the present invention are preferably constructed so that they can be installed with little or no adhesive. Such an adhesive-free carpet and method is described for example in U. S. Patent Application Serial No. 09/513,020, filed February 25, 2000, and entitled Adhesive-Free Carpet Tiles and Carpet Tile Installations (hereby incorporated by reference herein). Although it is preferred that the carpet composite, product, or construction of the present invention be installed with little or no adhesives, it is contemplated that any conventional installation materials or techniques may be used as well as novel installation materials or techniques of the present invention. For example, adhesives, water based adhesives, releasable adhesives, low VOC

adhesives, double sided (double sticky) tape, releasable fastening tape, releasable fastening means such as hook and loop fasteners or systems, and/or the like. It is preferred that the products of the present invention be installed with releasable adhesives, such as PeachPro™ 630 pressure sensitive
5 flooring adhesive sold by The W. W. Henry Company, of Aliquippa, Pennsylvania, double sided tape, releasable fastening tape, such as Easy Grip Microplast™ tape for installation of felt backed carpets sold by Gates of Europe, no adhesive, adhesive at doorways, walls, and junctions with other flooring, and the like.

10

In accordance with another embodiment of the present invention, a releasable adhesive or tack (will release from the floor) is added to the back or base of each tile by a coating process or chemical treatment (FIGS. 41, 44, or 45). In accordance with at least a residential embodiment, it is preferred that the
15 adhesive or tack provide lateral grip with little or no vertical stick and with little or no blocking (tiles can be packaged back to back without permanently sticking together).

Also, it is preferred that the adhesive or tack on the back of the tiles release
20 from the floor, not damage the floor, but still provide lateral grip and possibly some vertical stick. The floor or subfloor may be raised access flooring, plywood, wood particle board, hardwood, concrete, tile, ceramic tile, vinyl or laminate, or the like. Such a tack or grip layer on the back of the tile (whether it is foam or felt backed), helps the do-it-yourself installer install the tiles or roll
25 product without additional adhesives. One may add additional adhesive if desired in areas of high traffic, doorways, edges, etc. using conventional adhesives such as spray adhesives, liquid adhesives, tape, etc.

In accordance with at least one example, the tack or grip provides a non-skid
30 surface on the back of the tile to prevent tile movement after installation, when

stacked back to back in hot storage conditions, tiles have little adhesion between them, and the tiles can be easily separated without any damage. Further, it provides a low level of adhesion between an installed tile and subfloor to hold down tiles so that installation will not be affected by

5 vacuuming, traffic, and abuses, yet the adhesion force is small enough so that the tile can be easily removed and replaced without any damage to the tile or the subfloor.

In accordance with one particular example, resin materials were applied to the
10 surface of the tile backing at a coating weight of 2 oz/yd² or less, to obtain a peel strength of 0.4 lb/inch after applying a 0.7 Psi vertical load to 2 layers of tile with back-to-back contact. The resin materials are preferably selected from soft (durometer of 60 or less, glass transition temperature of 20 C or less) organic polymeric resins, such as acrylics, ethylene vinyl acetate polymers,
15 polyurethanes, SBR (styrene-butadiene rubbers), NBR, chloroprene, natural rubber, EPDM, silicone, and the like. Additionally, a tackifying agent may be added to further increase the coefficient of friction and adhesion of the surface treatment. Examples of tackifying agents includes rosin esters, hydrocarbon resins, phenol formaldehyde resins, and polyterpene resin. We have found
20 that when the coating weight on the tile is less than about 2 oz/yd² to provide a peel strength of less than about 0.4 lb/inch, an installed tile will have minimal lateral movement and can be easily removed and replaced without incurring any damage to the tile or the subfloor.

The resin materials can be applied to the back of a tile by coating, spray, impregnation, powder coating, and printing methods. Preferably, the tack or grip material is applied to the surface of the tile backing, by coating methods. Examples of coating methods, include floating knife, slot die coating, transfer
5 roll coating, air knife coating, and curtain coating processes. The resin materials can be applied in the form of waterbased latex emulsions, dispersions, solvent solutions, hot melt, UV curable liquid, single component and multicomponent reactive liquid resins, and solid powder resins. After application of the coating, a drying and or curing process may be used
10 depending on the form of the resin chosen.

The ASTM D 4518 -91 method was used to measure the static friction of tiles surface treated with resin materials. The sled was a 3X3 inch carpet tile and the specimen in the diagram was a clean glass plate. The minimal sliding
15 angle was about 45 degrees or more, preferably, 70 degrees or more.

The peel strength was measured by 1) pressing 2 pieces of 3x3 inch tile materials back-to-back under 0.7 Psi pressure; 2) leaving the pressed tiles in a 70 C oven for 2 days; 3) cooling the pressed tiles to room temperature and
20 measure peel strength using a force gauge. Similarly, a tile is pressed against different subfloor materials and aged at 90 C for 3 days before cooling to room temperature. The tile is peeled off from the subfloor. The peel force should be 1 lb/inch or less, preferably, 0.1 to 0.6 lb/inch. The tile and subfloor is then

inspected for any damage or residue.

Although it is preferred for the tufted modular carpet or modular carpet tile of the present invention to have at least the following layers: yarn, primary
5 backing, latex pre-coat adhesive, hot melt adhesive, fiberglass, rebond foam, and felt (FIGS. 15A, 19A, 50), it is contemplated that one or more of these layers may be eliminated or substituted for and still provide a carpet or tile having the desired properties or characteristics. For example, the latex pre-coat adhesive layer may be replaced by a bitumen hot melt layer (FIG. 20), the
10 felt layer may be eliminated on a free lay (no floor adhesive) installation product (FIGS. 25, 26, 27), the glass layer may be eliminated (FIG. 21, 26), or the like.

With reference to FIG. 22, the carpet construction may include two or more
15 layers of rebond foam. In particular, the foam backing of FIG. 22 includes a fiberglass layer sandwiched between two rebond foam layers and a felt backing on the bottom. Such a foam composite may be formed by flame lamination of the layers one to another (FIGS. 31 and 38) either simultaneously or sequentially.

20 With reference to FIGS. 36 and 36A of the drawings, a woven carpet construction or product 3610 includes a woven material 3620 attached to a rebond foam layer 3678 by an adhesive or pre-coat 3624. With reference to just FIG. 36, a backing material 3670 is attached to the foam layer 3678 by, for
25 example, flame lamination.

With reference to FIG. 37, a non-woven carpet construction or product 3710 includes a non-woven material 3734, one or more adhesive layers 3760, a
30 scrim material 3738, a reinforcement material 3758, a rebond foam layer 3778, and a backing material 3770. Adhesive layers 3760 attach the non-woven material 3734 to the backing composite 3758, 3778, 3770 (FIGS. 31 and 32).

As shown in FIG. 38, a backing material 170 (or composite) may be attached to the bottom side of a rebond foam layer 178 and a carpet 112 may be attached to the top of the rebond foam layer 178 by heat or flame (flame lamination) to form a carpet construction or product as shown for example in FIGS. 16A, 16B, 20, 21, and 36. The carpet 112 may or may not include a pre-coat layer 124 and may be tufted, bonded, woven, non-woven, etc.

With reference to FIGS. 33 and 34, a conventional filled polyurethane foam carpet tile cushion comprises an open cell or substantially open cell, filled, polyurethane foam formed by mechanical frothing and heat curing (FIG. 33). A preferred rebond foam material of the present invention such as a small chip size, high density, thin, polyurethane rebond foam has a reticulated or skeletal structure with substantially all of the cell walls blown out (FIG. 34). FIGS. 33 and 34 are cross-section micrographs taken at about 30 times magnification.

In accordance with the present invention, it was unexpectedly discovered that a small chip size, high density rebond foam layer or sheet made an excellent cushion back carpet tile construction (in place of conventional filled polyurethane foam). Also, it was unexpectedly discovered that a carpet tile containing such a rebond foam layer exhibited excellent comfort, wear, durability, sound deadening, cushion, comfort, resiliency, look, feel, seamability, and the like characteristics or performance. In other words, such a rebond foam containing carpet tile performed substantially as well as or better than conventional carpet tiles containing filled polyurethane foam or other conventional foams or cushions.

With reference to FIG. 35, the polyurethane rebond foam containing tufted carpet tile of the present invention performed as well as or better than a conventional filled polyurethane containing tufted carpet tile (same face). Also, both cushioned tiles performed better than a hardback tile. The cushion

backing tends to save the face of the tile, as well as provides under foot comfort, sound deadening, and anti-fatigue properties.

As shown in FIG. 39 wherein like parts are designated by corresponding
5 reference numerals within a 3900 series, it is contemplated that carpet construction 3910 has a primary tufted carpet fabric 3912 including tufts or pile 3920, primary backing 3922, and precoat or adhesive 3924, a reinforcement layer or material 3958, foam or cushion layer 3978, adhesive layer 3960, and backing layer 3970.

10

As shown in FIG. 40 wherein like parts are designated by corresponding reference numerals within a 4000 series, it is contemplated that carpet construction 4010 has a primary bonded carpet fabric 4012 including tufts or pile 4034, adhesive 4036, reinforcement or substrate 4038, a reinforcement
15 layer or material 4058, foam or cushion layer 4078, adhesive layers 4060, and backing layer 4070.

As shown in FIG. 41 wherein like components to those previously described are designated by corresponding reference numerals within a 4100 series, it is
20 contemplated that carpet construction 4110 includes an adhesive layer 4187, and a magnetic sheet or layer 4190 incorporated as the lower surface of a multi-component or composite backing.

The magnetic sheet 4190 provides for releasable attachment of the carpet
25 composite or tile 4110 to, for example, metal raised access floors or flooring panels. The magnetic sheet may be attached to the backing material (secondary backing) 4170 by one or more adhesive layers 4187 such as a hot melt adhesive or the adhesive on a self-stick magnetic sheet material. It is preferred that the magnetic sheet or layer 4190 be a flexible magnetic material
30 such as strontium ferrite (about 80% - 97%) and a bonding agent (about 20% - 3%) which is made magnetic or magnetized by passing it over a strong

magnet. Such a material is available from Flexmag Industries, Marietta, Ohio. Although it is preferred in this embodiment that the magnetic sheet or layer 4190 be continuous, it is contemplated that the magnetic material may be strips, pieces, or tapes.

5

U.S. Patent No. 4,397,900 is directed to a Magnetic Carpet Tile (and method) having a strip of magnetic material embedded in a PVC layer, and is hereby incorporated by reference herein. In this patent, the strip of magnetic material is placed on a conveyor and the PVC layer is formed thereover.

10

In accordance with one embodiment of the present invention, the magnetic sheet or layer 4190 is part of a composite backing (of backing material 4170, hot melt 4187, and magnetic sheet 4190) and is joined to the foam or cushion layer 4178 by a hot melt or adhesive layer 4171.

15

In accordance with another embodiment of the present invention, the magnetic sheet or layer 4190 already has the adhesive 4187 on one side thereof and is placed adhesive side up and joined to backing material 4170 by pressure and/or heat.

20

Moreover, while the multi-component backings of FIGS. 41 – 43 have been shown in connection with a loop pile tufted carpet construction, it is to be understood that such composite backings may be used in connection with any loop pile, cut pile, tufted or bonded carpet construction or other face textiles or materials such as woven, knitted or non-woven.

25

In accordance with other embodiments as shown in FIGS. 42 – 45, one or more hot melt or adhesive layers may be used to mate the primary carpet to the cushion layer (with or without the reinforcement material). The carpet composite or tile 4200 of FIGS. 42 and 43 includes a lower hot melt or adhesive layer having embedded therein one or more magnetic material strips

30

which like the magnetic sheet of carpet composite 4110 serve to releasably adhere the carpet to metal flooring, metal raised access flooring, or raised flooring panels. The magnetic strips of FIGS. 42 and 43 are preferably flexible magnetic strips which at least provide for flexibility along their length.

5

With reference, for example, to FIGS. 39 and 40, backing material or layers 3970 and 4070 may each be replaced by a magnetic sheet or layer 4190 or by magnetic strips (FIGS. 42, 43). The flexible magnetic strips may be formed of strontium ferrite in a binder, styrene butyldiene base thermoplastic material
10 with magnetic particles embedded therein, or the like providing sufficient holding power to the metallic surface upon which the tile is laid. The magnetic strips are preferably supplied from rolls and are embedded in a layer of hot melt adhesive which is attached to the foam layer (rebond foam) to form a cushion back carpet composite or tile having magnetic strips on the lower
15 surface thereof.

FIGS. 44 and 45 are directed to alternative constructions 4300 and 4400 each having a lower coating or film layer such as a hot melt or adhesive layer as the lower surface thereof. This lower coating or film layer may provide additional
20 adhesion to the floor and protects the lower surface of the foam layer (rebond foam). This lower coating or film layer may be applied with a spray coater, knife coater or roll coater such as a three roll coater, or may otherwise be laminated to the foam layer. It is preferred that this lower coating or film be relatively thin and flexible. The lower coating or film layer may be embossed or
25 textured (FIG. 45) to increase the friction with the floor, such as raised access panels or concrete surface, to enhance the adhesive-free installation of the tiles. Such friction coatings may be acrylic, urethane, any adhesive which dries to a "soft hand" to form a friction coating, any releasable adhesive, any tacky or sticky adhesive, resin or polymer, and/or the like.

30

Moreover while the coated or laminated backings of FIGS. 44 and 45 have been shown in connection with a loop pile tufted carpet construction, it is to be understood that such backings can be used in connection with any tufted or bonded carpet construction or other face materials or textiles such as woven,
5 knitted, or non-woven.

Another added feature of at least one embodiment of the present invention is that it incorporates rebond or recycled product and can be sold as such in the open market. As shown in FIGS. 28 – 30, rebonding is a process by which
10 manufacturers can receive waste polyurethane (typically furniture pad, waste generated through the manufacture of the virgin material, etc.), grind or chip the waste urethane into specific size chips, and then through a compression technique inject pure urethane and glue the chips back together the result of which is a large log of compressed urethane.

15 In accordance with the present invention, the urethane chips are usually a low density variety such as 1-3 lb/cu. ft. and may contain a low amount of high density foam crust pieces. After the compression and gluing takes place, the density can be as high as 15 lb/cu. ft. or more. Then this log is cut, slit or
20 peeled into roll lengths of almost any thickness. Then the lengths of foam are taken to a flame laminator and the non-woven secondary and the glass is bonded to each side of the rebond cushion and again rolled up. The only steps required from this point are the lamination of this composite to the pre-coated tufted carpet or to use a hot melt adhesive and the result is a cushion
25 composite which includes waste or recycled foam material and which is either rolled and shipped, dyed, rolled and shipped, cut into tiles and shipped, cut, dyed, packaged, and shipped, or the like.

For at least one embodiment of rebond carpet tile, we have found that it is
30 preferred to use as close a density and thickness as other cushion back carpet tile as possible and also to decrease substantially the chip size. As chip size is

decreased, the foam backing is much more attractive, stronger, and more uniform.

Also, we have found that a polyester urethane rebond foam is preferred (rather than polyether) for flame lamination of the felt and/or glass to the rebond foam. For example, the preferred rebond foam for flame lamination purposes may contain about 90-100% polyester urethane foam chips and a binder containing polyester prepolymer. Further, it is preferred that the rebond foam that is to be flame laminated contain at least about 25% polyester urethane foam chips. As most conventional rebond foam broadloom carpet pad is made up of a mixture of large chunks of polyurethane foam materials which are of different densities and of polyether urethane foam, such conventional materials would not be expected to work well with flame lamination.

In accordance with one particular embodiment of the present invention, a preformed rebond foam or pad is used to manufacture a commercial grade cushion carpet tile. A rebond pad of approximately 13 pounds/cubic foot density is modified to have a respective non-woven material bonded to each of the upper and lower surfaces thereof. The composite rebond pad has a thickness of approximately .25" and is slit in half, producing two foam backings, each approximately .125" thick with a non-woven material attached to one surface. Next, each backing is directly bonded using a hotmelt adhesive to either pre-coated tufted carpet or latex based bonded carpet (with or without an additional reinforcement material) and then cut into tiles.

There are several additional alternative ways of laminating the fabric to the rebond in the composite of the present invention. Such as:

1. Non-woven and/or glass can be first bonded to the rebond foam (since it is urethane) by flame lamination and then this composite is laminated to the carpet by use of an adhesive. This adhesive

can be hotmelt of many natures or it can also be a urethane either reactive or water based.

2. These composites can also be laminated using an adhesive film, low melt powder, low melt fibers, or the like.

3. These composites can be laminated to the rebond foam by use of urethanes, water based adhesives or hotmelts. This lamination can either occur off-line to form the composite or they can occur as an in-line operation as the carpet is laminated to the composite.

As well as other ways of laminating fabric to urethane foam, for example, using light reactive materials.

Rebond foam may be made by several methods such as forming a compressed cylindrical log and slitting or cutting a sheet therefrom, forming a rectangular block or loaf and slitting or cutting sheets therefrom, or other batch processes or continuous process such as extruding chips and binder, compressing the extrusion, and curing the compressed extrusion. In accordance with one continuous formation process of the present invention, the chips and binder are mixed together and placed between a backing material and a reinforcement material, then compressed and set or cured.

FIG. 49 shows a particular example of a shaped carpet product or tile having a double chevron on each of two opposing sides (preferably the upper and lower edges) and with the remaining two opposing sides being straight and parallel. Such tiles can be installed monolithic, Ashler, or the like. The double chevrons on opposite sides of the tile are preferably complements of one another (fit with an adjacent or abutting tile) in that on one side the chevrons are external chevrons, stick out or are convex, while on the other side the chevrons are

internal chevrons, recessed or concave. In the particular example shown in FIG. 48, the tiles have straight sides of about 17 inches, each chevron has a width of about 9 inches (one-half the tile width) and a depth of about one inch. Hence, the resultant tile has nominal outer dimensions of about 18"X18". One
5 can make a rectangular tile by either lengthening the straight sides (for example, making them about 23" or about 35" long) or by widening the chevrons or adding additional chevrons. In the particular potentially preferred example shown in FIG. 61, the tiles have straight sides of about 22 inches, each chevron has a width of about 11-1/2 inches, and a depth of about 1 inch.

10
FIGS. 49 – 60 and 63 show schematic representations of partial carpet tile installations of respective different shaped carpet tiles. Carpet tiles may be installed by starting at the center of the room or by starting along at least one wall of the room or space to be carpeted. FIG. 64 shows a complete
15 installation with edge tiles or cut carpet pieces along the walls or edges of the installation.

FIGS. 49, 51, 52, 56 – 59, and 64 show adjacent tiles or rows of tiles being offset. FIGS. 53, 54, 55, 60, and 63 show the tiles being aligned.

20
FIG. 51 shows rectangular tiles with a single chevron on two opposing sides or ends.

FIG. 52 shows rectangular tiles with multiple (triple) chevrons on two opposing
25 sides or ends.

FIG. 53 shows tiles with a single chevron on four sides thereof. Note that the opposing chevrons are preferably respective external and internal chevrons. Each tile is identical so that adjacent tiles can be fitted together and easily
30 aligned by inserting the external chevron of one tile in the internal chevron of the other. In this way, each tile is identical in shape. If the chevrons on one tile

are all external, then an adjacent or abutting tile would need internal chevrons. This would require at least two different tile shapes.

5 FIG. 54 shows a tile having a single lobe or curved element on four sides thereof.

FIG. 55 shows four square tiles each aligned with one another (no offset).

10 FIG. 56 (like FIG. 49) shows four tiles with two of the tiles being offset with respect to the other two. This offset of adjacent rows or columns of tiles helps break up the seams and reduce the likelihood of noticeable seams.

15 In some instances, for example, a ceramic tile look or a checkerboard pattern of light and dark tiles, it is desirable to see the seams or different tiles.

FIG. 57 shows a plurality of rectangular tiles arranged in an offset pattern (similar to that of hardwood flooring).

20 FIG. 58 shows a plurality of triangular shaped tiles arranged in an offset pattern.

FIG. 59 shows a plurality of diamond shaped tiles arranged in an offset pattern.

25 FIG. 60 shows a plurality of hexagonal tiles.

Although certain shapes may be preferred, such as the double chevron shown in FIG. 48, the present invention is not limited to any particular shape of carpet product or tile.

30 The following tables represent exemplary embodiments or examples of foam layer specifications of the present invention. Note that the designations

Commercial, Hospitality, and Residential are not limiting. For example, the Commercial specification embodiments may be used as Commercial, Hospitality, Residential and/or Institutional (hospitals, schools, etc.) products.

Also, the designation Carpet Tile is not limiting in that the product may be

5 carpet tile, roll product, area rug, etc.

A. Commercial Carpet Tile Rebond Foam Specifications

Foam Weight	14.5 oz/yd ²
Foam Density	8 lbs./ft ³
Foam Thickness (prelamination)	4 mm
Uncompressed Chip Size	7 mm
Chip Material	Polyurethane Foam
Binder or Prepolymer	15% by weight
Chips	82-85% by weight
Binder Material	Polyurethane Prepolymer
Compression Ratio	3:1
Colorant (may be added)	Milliken Reactint polyurethane colorant at about 3%

10 B. Commercial Carpet Tile Rebond Foam Specifications

Foam Weight	7.25 oz/yd ²
Foam Density	8 lbs./ft ³
Foam Thickness (prelamination)	2 mm
Uncompressed Chip Size	7 mm
Chip Material	Polyurethane Foam
Binder or Prepolymer	15% by weight
Chips	82-85% by weight
Binder Material	Polyurethane Prepolymer
Compression Ratio	3:1
Colorant (may be added)	Milliken Reactint polyurethane colorant at about 3%

C. Hospitality Carpet Tile Rebond Foam Specifications

Foam Weight	25.4 oz/yd ²
Foam Density	8 lbs./ft ³
Foam Thickness (prelamination)	7mm
Uncompressed Chip Size	7 mm
Chip Material	Polyurethane Foam
Binder or Prepolymer	15%
Chips	82-85%
Binder Material	Polyurethane Prepolymer
Compression Ratio	3:1
Colorant (may be added)	Milliken Reactint polyurethane colorant at about 3%

D. Residential Carpet Tile Rebond Foam Specifications

Foam Weight	25.4 oz/yd ²
Foam Density	8 lbs./ft ³
Foam Thickness (prelamination)	7mm
Uncompressed Chip Size	7 mm
Chip Material	Polyurethane Foam
Binder or Prepolymer	15%
Chips	82-85%
Binder Material	Polyurethane Prepolymer
Compression Ratio	3:1
Colorant (may be added)	Milliken Reactint polyurethane colorant at about 3%

E. Commercial Carpet Tile Rebond Foam Specification Ranges

Foam Weight	7 – 50 oz/yd ²
Foam Density	4 – 16 lbs./ft ³
Foam Thickness (prelamination)	2 – 7 mm
Uncompressed Chip Size	2 – 14 mm
Chip Material	Polyurethane Foam (polyester or polyether)
Binder or Prepolymer	5 – 20%
Chips	60 – 95%
Binder Material	Polyurethane Prepolymer (polyester or polyether)
Compression Ratio	2:1 – 5:1
Additives such as colorant, fiber, fill, etc.	0-20%

F. Preferred Commercial Carpet Tile Rebond Foam Specification Ranges

Foam Weight	10 – 18 oz/yd ²
Foam Density	7 – 12 lbs./ft ³
Foam Thickness (prelamination)	3 – 5 mm
Uncompressed Chip Size	5 – 8 mm
Chip Material	Polyurethane Foam (polyester or polyether)
Binder or Prepolymer	12 – 17%
Chips	78 – 88%
Binder Material	Polyurethane Prepolymer (polyester or polyether)
Compression Ratio	3:1
Additives such as colorant, fill, fiber, etc.	0-5%

G. Hospitality Carpet Tile Rebond Foam Specification Ranges

Foam Weight	7 – 84 oz/yd ²
Foam Density	4 – 16 lbs./ft ³
Foam Thickness (prelamination)	2 – 10 mm
Uncompressed Chip Size	2 – 14 mm
Chip Material	Polyurethane Foam (polyester or polyether)
Binder or Prepolymer	5 – 20%
Chips	60 – 95%
Binder Material	Polyurethane Prepolymer (polyester or polyether)
Compression Ratio	2:1 – 5:1
Additives such as colorant, fill, fiber, etc.	0-20%

H. Preferred Hospitality Carpet Tile Rebond Foam Specification Ranges

Foam Weight	10 – 28 oz/yd ²
Foam Density	6 – 10 lbs./ft ³
Foam Thickness (prelamination)	5 – 8 mm
Uncompressed Chip Size	5 – 8 mm
Chip Material	Polyurethane Foam (polyester or polyether)
Binder or Prepolymer	12 – 17%
Chips	83 – 88%
Binder Material	Polyurethane Prepolymer (polyester or polyether)
Compression Ratio	3:1
Additives such as colorant, fill, fiber, etc.	0-5%

I. Residential Carpet Tile Rebond Foam Specification Ranges

Foam Weight	7 – 84 oz/yd ²
Foam Density	4 – 16 lbs./ft ³
Foam Thickness (prelamination)	2 – 20 mm
Uncompressed Chip Size	2 – 20 mm
Chip Material	Polyurethane Foam (polyester or polyether)
Binder or Prepolymer	5 – 20%
Chips	60 – 95%
Binder Material	Polyurethane Prepolymer (polyester or polyether)
Compression Ratio	2:1 – 5:1
Additives such as colorant, fill, fiber, etc.	0-20%

J. Preferred Residential Carpet Tile Rebond Foam Specification Ranges

Foam Weight	10 – 28 oz/yd ²
Foam Density	5 – 10 lbs./ft ³
Foam Thickness (prelamination)	5 – 12 mm
Uncompressed Chip Size	5 – 15 mm
Chip Material	Polyurethane Foam (polyester or polyether)
Binder or Prepolymer	12 – 17%
Chips	83 – 88%
Binder Material	Polyurethane Prepolymer (polyester or polyether)
Compression Ratio	3:1
Additives such as colorant, fill, fiber, etc.	0-5%

K. Carpet Tile Rebond Foam Specifications

Foam Weight	14.5 oz/yd ²
Foam Density	8 lbs./ft ³
Foam Thickness (prelamination)	4 mm
Uncompressed Chip Size	7 mm
Chip Material	Polyurethane Foam
Binder or Prepolymer	15%
Chips	80-85%
Binder Material	Polyurethane Prepolymer
Compression Ratio	3:1
Additives such as filler, colorant, fiber, etc.	0-5%

L. Flame Laminated Carpet Tile Rebond Foam Specifications

Foam Density	9 lbs./ft ³
Foam Thickness (prelamination)	4-4.5 mm
Uncompressed Chip Size	7 mm
Chip Material	Polyurethane Foam (minimum 25% polyester)
Binder or Prepolymer	10 - 15%
Chips	85 - 90%
Binder Material	Polyurethane Prepolymer
Compression Ratio	3:1

M. Hot Melt Laminated Carpet Tile Rebond Foam Specifications

Foam Density	9 lbs./ft ³
Foam Thickness (prelamination)	4 mm
Uncompressed Chip Size	7 mm
Chip Material	Polyurethane Foam (can be 100% polyether)
Binder or Prepolymer	10 - 15%
Chips	85 – 90%
Binder Material	Polyurethane Prepolymer
Compression Ratio	3:1

N. Carpet Tile Rebond Foam Specifications

Foam Weight	14.5 oz/yd ²
Foam Density	8 lbs./ft ³
Foam Thickness (prelamination)	4 mm
Uncompressed Chip Size	7 mm
Chip Material	Polyurethane Foam
Binder or Prepolymer	10 – 20%
Chips	80-90%
Binder Material	Polyurethane Prepolymer
Compression Ratio	3:1
Additives (colorant, filler, anti-microbial agent, flame retardant, anti-fungal agent, fillers, solid particles, and/or the like)	0 – 10%

O. Broadloom Rebond Foam Specifications

Foam Weight	25.4 oz/yd ²
Foam Density	8 lbs./ft ³
Foam Thickness (prelamination)	7 mm
Uncompressed Chip Size	7 mm
Chip Material	Polyurethane Foam
Binder or Prepolymer	15%
Chips	82-85%
Binder Material	Polyurethane Prepolymer
Compression Ratio	3:1
Colorant	Milliken Reactint polyurethane colorant (at about 3%)

P. Residential Carpet Tile Rebond Foam Specifications

Foam Density	6 lbs./ft ³
Foam Thickness (prelamination)	7 - 8 mm
Uncompressed Chip Size	15 mm
Chip Material	Polyurethane Foam
Binder or Prepolymer	15% by weight
Chips	82-85% by weight
Binder Material	Polyurethane Prepolymer
Compression Ratio	3:1
Colorant (may be added)	Milliken Reactint polyurethane colorant at about 3%

Q. Residential Carpet Tile Rebond Foam Specifications

Foam Density	6.3 lbs./ft ³
Foam Thickness (prelamination)	7 mm
Uncompressed Chip Size	7 mm
Chip Material	Polyurethane Foam
Binder or Prepolymer	15% by weight
Chips (free of unbonded material)	82-85% by weight
Binder Material (free of binder knots)	Polyurethane Prepolymer
Compression Ratio	3:1
Colorant (may be added)	Milliken Reactint polyurethane colorant at about 3%

R. Residential Carpet Tile Rebond Foam Specifications

Foam Density	3 lbs./ft ³
Foam Thickness (prelamination)	6 mm
Uncompressed Chip Size	5 mm
Chip Material	Polyurethane Foam
Binder or Prepolymer	15%
Chips	82-85%
Binder Material	Polyurethane Prepolymer
Compression Ratio	2:1
Colorant (may be added)	Milliken Reactint polyurethane colorant at about 3%

S. Flame Laminated Carpet Tile Rebond Foam Specifications

Foam Density	6 - 9 lbs./ft ³
Foam Thickness (prelamination)	4 - 7 mm
Uncompressed Chip Size	7 - 15 mm
Chip Material (prefer 90% or more polyester)	Polyurethane Foam (minimum 25% polyester)
Binder or Prepolymer	10 - 15%
Chips	85 - 90%
Binder Material	Polyurethane Prepolymer
Compression Ratio	3:1

In accordance with at least one embodiment of the invention, a residential carpet is made in a modular form that has unique features that allow it to appear seamless, have an attached cushion pad, be easy to install in a residential environment, and be similar in look and comfort to residential broadloom carpet.

The specifications for preferred forms of such residential carpet products are described in the tables below:

T. Residential Tile

Preferred Embodiment

	(A)	(B)
1.	Product Name:	Milliken ® Pattern Mates™ cushion back carpet tile
2.	Face:	High Twist Frieze Cut pile
3.	Primary Backing:	Woven polypropylene (PolyBac - 4 oz/yd ²)
4.	Total Finished Yarn Weight:	38 oz/yd ²
5.	Stitches Per Inch:	7.81
6.	Tufting Gauge:	1/8
7.	Yarn Polymer:	Nylon 6,6
8.	Yarn Type:	1180 filament, with antistat, semi dull trilobal, 17 dpf

9.	Yarn Twist:	7.50 twist per inch in singles (S) and ply (Z)
10.	Yarn Ply:	2 ply twisted
11.	Heatset:	Yes, @ 260 to 264 °F with steam frieze
12.	Yarn Size:	3.69/2 cotton count
13.	Tufted Pile Height:	48/64 inches (3/4")
14.	Dyeing Method	Jet Dye, Millitron® jet dye machine

23.	Flame Lamination	Felt flame laminated to foam
24.	Release Layer construction:	Nonwoven felt
25.	Release Layer composition	70% polyester/ 30% polypropylene blend
26.	Release Layer weight:	4 oz/yd ²
27.	Modular Shape:	18" square or nominal 23" x 23" two-side double chevron
28.	Modular Size:	18" square or nominal 23" x 23"
29.	Cutting Method:	Controlled Depth cut from the back
30.	Preferred Color	Beige

A preferred residential carpet tile, roll product, or carpet product can preferably
 5 be installed on a residential floor with a seamless or near seamless appearance. There are several factors why seams between the installed tiles can be virtually invisible to an observer in a room.

1. There is preferably equal density of yarn at the tile joint or seam line compared to the interior surface of the tile. In a typical commercial carpet
 10 tile, there is lower density at the edges of the tile because yarn is lost in the full depth tile cutting process during manufacturing.
2. This product is preferably cut with controlled depth cutting that cuts through

the carpet backing and not through the yarn. Nearly 100% of the yarn is preserved at the cut edge. See FIG. 46.

3. This product is preferably a cut pile construction that allows controlled depth cutting. A loop pile construction requires a full depth cut to cut all the yarn loops at the tile edge.

4. This product preferably has a lot of yarn that extends past the vertical plane of the tile edge. See FIG. 47. This yarn over the edge facilitates the easy blending of yarn from adjacent modules across the tile joint. This allows the edge yarn to hide the seams so that the modular units to look nearly seamless immediately after installation.

5. The preferably high twist frieze yarn is the reason the yarn wants to spill over the edge of the vertical tile plane. The liveliness, length, and flexibility of this yarn and density of the carpet pile creates a lateral force that pushes the yarn past the tile edge.

6. A preferably non-linear edge on a non-square shaped tile minimizes the continuous linear segment lengths of a tile joint (especially in the non-process direction). This further breaks up the tile seam line and makes it less noticeable to the human eye. See FIGS. 48 and 49.

7. An installation method that off-sets the position of the tile into a brick-like or Ashler pattern also reduces the continuous linear segment length of a tile joints. See FIG. 49.

This residential carpet tile preferably has an attached, integral cushion material made of a small chip, rebond type polyurethane backing or a partially filled

prime polyurethane foam. Large chip, thick, frangible, rebond foam pad is a familiar broadloom carpet pad to the homeowner. Eighty percent of the cushioning used in U.S. residential broadloom carpet market is a large chunk, variable density, thick, rebond material.

5

The preferred residential carpet product is designed to be easy to install. One target market is people who are likely to undertake "do-it-yourself" (D-I-Y) projects in the home environment. Target retailers include department stores, home centers, and hardware stores such as Wal-Mart, Target, K-mart, Lowe's,

10 Home Depot, Ace Hardware, etc.

The reasons the preferred residential carpet product is easy to install are:

1. The product is a modular unit that is small enough in size to be easily handled by one person. For example, 18" square, 18"X24" rectangle, 24" square, 36" square, 18"X36" rectangle, 24"X36" rectangle, nominal 18"X19", 23"X23", or 24"X24" two sided single chevron or multiple chevron, nominal 19"X19" four sided single or multiple chevron, nominal 24"X26" two sided single or multiple chevron, nominal 26"X26" four sided single or multiple chevron, 18" sided right triangle, 24" sided right triangle, 18" sided diamond, 24" sided diamond, nominal 18"X36" bone shaped, 9" square border tiles, 6"X9" rectangular border tiles, 4"X9" rectangular frame tiles, 24" wide octagonal tiles, edge tiles which complement the other tiles, and the like. A conventional roll of broadloom carpet is long (12 foot or more), heavy, awkward, and generally unmanageable for one person.

15

20

2. The preferred Two-sided Double Chevron tile shape of the present invention is notched so the tile edges have a definite fit and arrangement. This insures that the files are installed with the process direction of each tile aligned. The double chevron or notch allow each row of tiles to be off-set by one half the width of a tile. This makes it easy to align the tiles for fast installation. See FIG. 49.

3. The possible adhesion methods are:

a. Freelay or adhesive free— no adhesion necessary

b. Modular adhesive – a water-based adhesive that is pressure sensitive and prevents the tile from moving in a horizontal direction. Can be used with 100% floor coverage or in a partial floor coverage grid-like application. Also, it can be applied to the back of each tile in full tile coverage or in a pattern.

c. Double-sided tape or releasable fastening tape – Used to secure the tiles to the floor in a partial coverage application.

d. Anchor tile – At least one or several tiles are anchored to the floor with double sided tape or modular adhesive and all other tiles are installed freelay or adhesive free around the anchor tile.

e. Anchor edges – Use double sided tape or adhesive to adhere tiles at doorways, steps, edge of inlay, around perimeter of room, etc.

Total Product Construction

See FIGS. 3B, 6B, 7B, 8B, 9B, 10B 11B, 12B, 13B, and 50.

Residential Tile Ranges/Alternatives

Preferred Embodiments			Possible Range	
(A)		(B)		
1.	Product Name:	Residential Modular Product or System	Low	High
2.	Face:	loop pile, cut & loop pile, tufted cut-pile, bonded cut-pile, woven, knit, nonwoven, or textured pile		
3.	Primary Backing:	Nonwoven polyester, nonwoven polypropylene, or woven propylene with nylon needlepunched cap, woven polypropylene with a polypropylene cap, woven polypropylene with a polyester cap and low melt polyester binder		
4.	Total Finished Yarn Weight:	oz/yd ²	12	70
5.	Stitches Per Inch:		5	14
6.	Tufting Gauge:	1/8, 1/10, 5/64	5/32	1/10
7.	Yarn Polymer:	Nylon 6,6, Nylon 6, Polyester, Polypropylene, Wool, or Wool/Nylon blend		
8.	Yarn Type:	Filament, spun, or staple	900	2800
9.	Yarn Twist:		3	8
10.	Yarn Ply:	Twisted - 2 ply, 3-ply, 4 ply, unplied singles yarn, or air entangled yarn; Cabled - 2 ply, 3 ply or 4 ply		
11.	Heatset:	Heatset or non heatset yarn; heatset frieze without steam	250	275
12.	Yarn Size:		2.90/2	1.90/2
13.	Tufted Pile Height:	Inches	1/8	2
14.	Dyeing Method	Jet dye, flood dye, yarn dye, space dye, combination flood dye & jet dye, or beck dye (may also be printed or graphics tufted)		
15.	Precoat Adhesive:	Styrene Butadiene Latex, hot melt, ethyl vinyl acetate, acrylic, polyvinyl chloride, or no precoat adhesive	8	40
16.	Lamination Tiecoat Adhesive:	Hotmelt with a bitumen and polypropylene resin base, polypropylene hot melt, bitumen hot melt, polyethylene hot melt, or polyurethane styrene butadiene rubber		
17.	Upper Tiecoat Coating Weight:	oz/yd ²	20	70
18.	Stabilizing Reinforcement:	Fiberglass mat with modified acrylic binder, no reinforcement, fiberglass scrim, polyester scrim, or fiberglass mat with urea formaldehyde binder or melamine binder	0.9 oz./yd. ²	3.5 oz./yd. ²
19.	Lower Tiecoat	oz/yd ² (or flame lamination)	0	35

	Coating Weight:			
20.	Cushion Type:	Rebond polyurethane foam, virgin filled polyurethane foam, prime polyurethane foam, styrene butadiene rubber foam, polyethylene foam, polyvinyl chloride foam, or nonwoven felt		
21.	Cushion Thickness	Millimeters (prelamination)	1	18
22.	Cushion Density	lbs/ft ³	5	25
23.	Release Layer construction:	Nonwoven or woven		
24.	Release Layer composition	% polyester/ % polypropylene blend	0%/100%	100%/0%
25.	Release Layer weight:	oz/yd ²	1	6
26.	Modular Shape:	square, rectangle, single chevron, two sided double chevron, four sided double chevron, hexagon, single chevron, multi-chevron, double axe head, tomahawk, sine wave edge (double-sided or four sided), bone, etc.		
27.	Modular Size:	Inches per side (or inches of width for roll product)	4	72
28.	Cutting Method:	Controlled depth or full depth		
29.	Preferred Colors	Solids (Beige, Green, Blue, Gray, Pink, Brown, Taupe, White, Red), patterns, designs, or combinations thereof		

U.S. Patent No. 5,929,145 describes bitumen backed carpet tile and bitumen compositions suitable for carpet tile backing and is hereby incorporated by reference.

The foam backed or cushion backed carpet composite, carpet product or carpet tile of the present invention preferably provides sound deadening especially over raised access flooring, reduced drum head noise, comfort, durability, anti-fatigue, cushioning, excellent design or pattern registration, hidden seams, recycled content, and/or the like.

In accordance with one production process of the present invention, the latex pre-coat is replaced with a hot melt pre-coat such as shown in FIGS. 6A, 6B,

7A, 7B, 39, and with the backing attached to the foam by an adhesive as shown in FIGS. 10A, 10B, 39, and 40.

In one embodiment, the first hot melt coating or pre-coat would be directly to the carpet with some type of physical motion to press the hot melt into the yarn bundle before it has a chance to cool. As hot melt cools it rises very quickly in viscosity. This coater would be a roll coater or the like such that the roll would directly turn on the backside of the yarn and push the coating into the yarn or a curtain coater which would have a static bar to roll or push the coating into the yarn. The hot melt formulation viscosity would be as low as possible and range from about 200cps to 5000cps. This low viscosity has been reached by taking filler out of the hot melt formula. When filler is still present in hot melt and the viscosity is lowered then "filler fall out" becomes a problem. The hot melt would then be constantly circulated in some manner to prevent the filler from settling.

Immediately after this coating is pushed into the yarn, a cooled nip roll would press the yarn flat and instantaneously cool the hot melt which would hold the bulky yarn flat. This would minimize both the amount of pre-coat and the amount of subsequent coatings required. At this same nip point or even with a cooled drum, a layer of non-woven glass reinforcement would be laminated to the pre-coated carpet. Application rate for the hot melt pre-coat would be between about 10 oz/sq. yd to 50 oz/sq. yd, preferably about 10-20 oz/sq. yd.

This coated/laminated carpet composite would then proceed to the next hot melt coater where a very light weight high viscosity hot melt adhesive layer would be applied. This formula could be again a modified hot melt adhesive but would need to be high viscosity to prevent penetration of the hot melt into the rebond foam. This modification can be made by decreasing the particle size of the filler or adding ground up carpet waste. By increasing the surface area of the filler or by introducing fiber to the compound raises the viscosity. The ideal viscosity would be from about 50,000 cps to 200,000 cps. The

adhesive layer hot melt application rate would be from about 3oz/sq yd, to 8 oz/sq yd, preferably about 5 oz/sq yd. This should be a lightweight coating applied to the glass side of the carpet laminate. This could be done with a curtain coater, an engraved roll or a doctor blade coater. Either coater could
5 be supplied by use of a small extruder to handle the high viscosity and also to add the recycled carpet waste at the same time. After this lightweight coating is applied at high viscosity, then the rebond foam could be laminated to the carpet/glass composite again around a cooling drum.

10 The third and last hot melt coater would be an engraved roll coating the rebond foam side directly and then applying the nonwoven fabric or coating the nonwoven backing and pressing the composite into the coating. The formula for this hot melt adhesive application would be the same as for the adhesive
15 between the glass and rebond foam since again minimum penetration into the foam is desired. A curtain coater on the nonwoven side might also be considered. Again carpet waste could be introduced. Application rates and viscosity would be the same as for the other hot melt adhesive layer (FIGS. 39 and 40).

20 Flame lamination rather than coating is desired for an attached cushion broadloom product to allow the composite to be rolled up.

In a process having a hot melt pre-coat a polyester primary backing or a heat stabilized primary backing is preferred to withstand the heat from hot melt pre-
25 coating.

The invention may be further understood by reference to the following additional examples which are not to be construed as unduly limiting the invention which is to be defined and construed in light of the appended claims.

30

EXAMPLE I

A tufted carpet is produced by the apparatus and process as illustrated and described in relation to FIG. 2. The carpet has the configuration illustrated and described in relation to FIG. 3A. The production parameters are as follows:

5	Yarn	15 ounces per sq. yd. nylon 6,6 loop pile continuous filament
	Primary Backing	4 ounces per sq. yd. non-woven polyester
10	Pre-coat	16 ounces per sq. yd. SBR Latex filled with 100 parts CaCO.sub.2.
	Hot Melt Adhesive Laminate	42 ounces per sq. yd. modified polypropylene
15	Reinforcement	2 ounces per sq. yd. Non-woven glass with acrylic binder
	Urethane Rebond Foam Coverage	20 ounces per sq. yd.
20	Urethane Rebond Foam Density	16 pounds per cubic foot
	Backing Material	4 ounces per sq. yd. Non-woven (50% polypropylene, 50% polyester)
25	EXAMPLE II	
	Construction	Tufted, Textured Loop Pile
	Face Fiber	100% Milliken Certified
	WearOn® Nylon	
	Soil Protectant	MilliGuard®
30	Antimicrobial	AlphaSan™
	Dye Method	Millitron® Dye Injection Printing

	Gauge	1/10 in. (39.4/10cm.)

25	EXAMPLE IV	
	A tufted carpet is produced by the apparatus and process as illustrated and described in relation to FIG. 2. The carpet has the configuration illustrated and described in relation to FIG. 3A. The production parameters are as follows:	
	Yarn	29 ounces per sq. yd. nylon 6,6 loop pile continuous
30		filament, white, 1350 denier, not plied, not twisted,
		not heat set

	Primary Backing	4 ounces per sq. yd. non-woven polyester
5	Pre-coat parts CaCO.sub.2.	16 ounces per sq. yd. SBR Latex filled with 100
	Hot Melt Adhesive	36 ounces per sq. yd. modified polypropylene
10	Laminate Reinforcement	2 ounces per sq. yd. Non-woven glass with acrylic binder
	Urethane Rebond Foam Coverage	15 ounces per sq. yd.
15	Urethane Rebond Foam Density	16 pounds per cubic foot
	Backing Material	4 ounces per sq. yd. Non-woven (50% polypropylene, 50% polyester)
20	EXAMPLE V	
	A tufted carpet is produced by the apparatus and process as illustrated and described in relation to FIG. 2. The carpet has the configuration illustrated and described in relation to FIG. 3A. The production parameters are as follows:	
25	Yarn	24 ounces per sq. yd. nylon 6,6 loop pile continuous filament
	Primary Backing	2 ounces per sq. yd. non-woven polyester
30	Pre-coat parts CaCO.sub.2.	14 ounces per sq. yd. SBR Latex filled with 100

Hot Melt Adhesive 38 ounces per sq. yd. modified polypropylene

Laminate

Reinforcement 3 ounces per sq. yd. Non-woven glass with acrylic
5 binder

Urethane Rebond Foam Coverage 22 ounces per sq. yd.

Urethane Rebond Foam Density 9 pounds per cubic foot
10

Backing Material 2 ounces per sq. yd. Non-woven (50%
polypropylene, 50% polyester)

EXAMPLE VI

15 A tufted carpet is produced by the apparatus and process as illustrated and
described in relation to FIG. 5. The carpet has the configuration illustrated and
described in relation to FIG. 6A. The production parameters are as follows:

Yarn 40 ounces per sq. yd. nylon 6,6 loop pile

20 Primary Backing 4 ounces per sq. yd. non-woven polyester

Laminate

Reinforcement 2 ounces per sq. yd. Non-woven glass with acrylic
binder

25

Urethane Rebond Foam Coverage 36 ounces per sq. yd.

Urethane Rebond Foam Density 16 pounds per cubic foot

30 Backing Material 4 ounces per sq. yd. Non-woven (50%
polypropylene, 50% polyester)

EXAMPLE VII

A tufted carpet is produced by the apparatus and process as illustrated and described in relation to FIG. 19. The carpet has the configuration illustrated

5 and described in relation to FIG. 18. The production parameters are as follows:

Yarn	15 ounces per sq. yd. nylon 6,6 loop pile continuous filament, white, 1350 denier, not plied, not twisted, not heat set
------	---

10

Primary Backing	4 ounces per sq. yd. non-woven polyester
-----------------	--

Pre-coat	16 ounces per sq. yd. SBR Latex filled with 100 parts CaCO.sub.2.
----------	---

15

Reinforcement Material	2 ounces per sq. yd. Non-woven glass with acrylic binder
------------------------	--

Urethane Rebond Foam Coverage	20 ounces per sq. yd.
-------------------------------	-----------------------

20

Urethane Rebond Foam Density	16 pounds per cubic foot
------------------------------	--------------------------

In one survey of 64 people rating carpet tiles for walking and standing comfort, the rebond foam containing bonded carpet tiles of the present invention scored

25 higher for comfort (over 75% of the participants ranked the rebond tiles as their number one choice for comfort) than conventional filled polyurethane containing bonded carpet tiles or conventional bonded hard back carpet tiles (same face).

30 In another survey of over 75 participants, the number one choice for comfort was rebond foam containing carpet tiles (7 mm thick, 9 lb. density, 7 mm chip

size, polyurethane rebond foam) as compared to conventional filled polyurethane containing carpet tiles, rebond foam containing carpet tiles with less foam (4 mm thick, 9 lb. density, 7 mm chip size, polyurethane), rebond foam containing tiles with even less foam (2 mm thick, 9 lb. density, 7 mm chip size, polyurethane), and lastly conventional vinyl hardback carpet tiles (same face). In this survey, about 89% chose the thick rebond foam tiles as providing the most comfort, and about 11% chose the medium rebond foam tiles as providing the most comfort.

Test Method Conducted
ASTM D-5252 Hexapod Drum Tester
ISO/TR 10361 Hexapod Tumbler
Ratings Based on CRI TM-101 Photographic Scales

APPARATUS: WIRA INSTRUMENTATION HEXAPOD TUMBLER CARPET TESTER PROCEDURE:

The test specimen (rebond cushion back carpet tile of the present invention, same face and cushion thickness as standard Milliken Comfort Plus® cushion back carpet tile) is subjected to the reported cycles of "Hexapod" tumbling, removing the specimen every 2,000 cycles for restoration by vacuuming.

An Electrolux upright vacuum cleaner (Discovery II) is used, making four (4) forward and backward passes along the length of the specimen.

The samples are assessed using daylight equivalent vertical lighting (1500 lux). Samples are viewed at an angle of 45 degrees from 1 ½ meter distance, judging from all directions.

TEST RESULTS

Number of Hexapod	4000	12000	Key to Ratings
-------------------	------	-------	----------------

Cycles			
Color Change	4-4.5	3-3.5	5 = Negligible or no change
			4 = Slight change
Overall Appearance	4	3	3 = Moderate change
			2 = Considerable change
			1 = Severe change

Comfort Rating

1. Gmax – Max simulates footfall onto a surface. The measure is reported as multiples of “g” (gravities), or Gmax. The lower the value, the lower the force upon impact, and the more comfortable underfoot the product feels. The higher the value, the higher the force upon impact, and the less comfortable the carpet feels.

Gmax Test Results

- Standard Milliken ComfortPlus® cushion-backed carpet tile – 116
- Rebond cushion backed carpet tile of the present invention (same face and cushion thickness as standard Milliken Comfort Plus® cushion back carpet tile)– 121
- Standard commercial broadloom without underlayment – 185
- Standard hardback carpet tile, such as Everwher a PVC hardback – 227

Resilience Rating/Ball Bounce

Cushion Resilience – Cushion resiliency measures the rebound percent of a metal ball when dropped from a standard height. It shows the shock absorbing character of the cushion, which helps reduce visible wear of the carpet face. The higher the value, the higher the rebound percent, and the more resilient the cushion.

Resilience Results

- Standard Milliken ComfortPlus® cushion backed carpet tile – 30

Rebond polyurethane cushion back carpet tile of the present invention (same face and cushion thickness as standard Milliken Comfort Plus® cushion back carpet tile) – 29

Standard commercial broadloom without underlayment – 17

5 Standard hardback carpet tile– 13

Appearance Retention

Appearance Retention Rating (ARR) – the ARR value is determined by grading the appearance change of carpet subjected to exposure
10 conditions in accordance with either the ASTM D-5252 (Hexapod) or ASTM D-5417 (Vettermann) test method using the number of cycles for short and long-term tests specified.

ARR – Light (short-term ≥ 3.0 , long-term ≥ 2.5)

ARR – Moderate (short-term ≥ 3.5 , long-term ≥ 3.0)

15 ARR – Heavy (short-term ≥ 4.0 , long-term ≥ 3.5)

The rebond foam modular carpet tile of the present invention (same face and cushion thickness as standard Milliken Comfort Plus® cushion back carpet tile) had an APR of about 4.5 short term and 3.5 long term.

20 Durability

The polyurethane rebond cushion back carpet tile of the present invention (same face and cushion thickness as standard Milliken Comfort Plus® cushion back carpet tile) is very durable and can withstand 25,000 cycles or more of the
caster chair test without failure.

25

EN 1307 : Classification of pile carpets

This standard sorts carpets into four categories, depending on their ability to withstand differing degrees of wear.

30

The categories are:

Class 1 Light intensity of use (domestic only).

Class 2 General (domestic or very light contract).

Class 3 Heavy, eg use in general contract areas.

Class 4 Very Heavy, eg use in Extreme contract areas.

5

Three test methods are combined to provide the classification,

1. Fuzzing or loss of mass , on the step - scuff test EN 1963.
2. I (tr) according to EN 1963. The carpet is shorn down to the backing, and various parameters such as Surface Pile weight and height, Surface pile density are measured.

10

I (tr) is a numerical value calculated according to a mathematical formula which includes the above test measurements.

15

The required value of I (tr) is higher the higher the classification.

3. Hexapod or Vettermann drum test for change in surface appearance , ISO/TR 10361.

20

Again, the higher the class, the higher the requirement.

In addition, there are requirements for either minimum Surface Pile weight, or Surface Pile density for contract-grade carpets.

25

This system is used for carpets with low, dense pile. There is a different system for carpets with high pile.

It is preferred to have a carpet composite or tile with a castor chair rating of >2.3 (test and evaluation method EN 54324.) A 2.4 or higher is a contract rating.

30

It is preferred to have a carpet composite or tile with EN 1307 rating of >2.

It is preferred to have a carpet composite or tile with Herzog walking comfort rating for contract use (DIN 54327) of >0.7.

5	<u>PVC</u>	<u>Rebond Foam</u>	<u>Filled Polyurethane</u>
	0.71	0.80	0.77 Walking comfort for domestic use
	0.96	1.04	0.97 Walking comfort for contract use

10

All tufted loop construction where higher value is most comfortable.

- 15 Hexapod test (ISO 10361 Method B) results are: 4,000 revs rating 4.5
12,000 revs rating 4.0 for tufted, 3.5 for bonded
overall Class 4

- 20 Castor Chair test (EN 985) results are: 5,000 revs rating 3.0 tufted 2.5 bonded
25,000 revs rating 2.5 tufted, 2.0 bonded
overall value 2.9 tufted, 2.4 bonded

Carpet Tile with Rebond Foam

25

	<u>2mm rebond foam</u>	<u>4mm rebond foam</u>	<u>7mm rebond foam</u>
Hexapod			
(2000 cycles)	5.0	4.5	5.0
(4000 cycles)	4.5	4.5	4.5
30 (8000 cycles)	4.0	4.0	3.5
(12000 cycles)	3.0	3.5	3.5
(24000 cycles)	2.5	3.0	3.0

(48000 cycles)	2.5	2.5	3.0
Caster Chair	3.5	3.0	4.5
GMax	140	104	79.6
Ball Bounce	29.1	29.5	29.2

- 5 (The carpet tile face for each was a 20 oz., loop pile, 1/8 gauge tufted, nylon 6,6 and the construction was like that of FIGS. 15A or 19A.)

10	Foam Tests	9 lb. sm. chip	Filled	8 lb. lg. chip
		Rebond foam	Polyurethane	Rebond Foam
	Compression Set	7.0%	5.1%	11.8%
	Compression Resistance	2.8 psi	6.5 psi	14.4 psi

- 15 As will be appreciated, the carpet construction of the present invention may take on any number of other constructions aside from those that have been particularly illustrated and described. By way of example only, the carpet construction of the present invention may take on the configuration as disclosed in co-pending U. S. Patent Application Serial No. 09/513,020, filed
- 20 February 25, 2000, and entitled Adhesive-Free Carpet Tiles and Carpet Tile Installations (hereby incorporated by reference herein). The carpet tiles of the instant invention may be manufactured according to strict manufacturing requirements such that no corner of any tile has a cup of greater than 3/16", and no corner has a curl of greater than 1/16". Even more preferably, no
- 25 corner of any tile has a cup of greater than 2/16" or a curl of greater than 1/32". The individual cushion backed carpet tiles made according to these specifications can be used to provide floor covering installations having a plurality of carpet tiles installed without the use of an adhesive to hold the tiles in place.

It is preferred that the carpet or carpet tiles of the present invention be dimensionally stable cushioned carpet or carpet tiles suitable for disposition as discrete modular units across a surface, such as a flooring surface.

- 5 Also, it is preferred that the carpet or carpet tiles of the present invention be sufficiently stable to withstand the rigors of the injection dye printing process without substantial shrinkage, cupping, curling, etc. The stabilized carpet or carpet tile of the present invention includes one or more stabilizing layers, such as a fiberglass mat. Also, it is preferred that they include at least one resilient
10 adhesive layer which tends to spread out a load across the carpet or carpet tile and still provides some flexibility to the tile.

Although a cut pile tufted face residential tile is preferred, it is contemplated that the residential tiles may have a loop pile tufted face, especially a short,
15 tight loop pile which would be less likely to show seams.

In accordance with selected embodiments of residential, do-it-yourself, carpet tile, the latex precoat and/or fiberglass mat may be eliminated.

- 20 In accordance with one embodiment, it is preferred to install the tiles of the present invention with a releasable adhesive or means having or requiring a release force of less than 7 lbs per square inch (to pull up the tile), more preferably less than 5 lbs per square inch. Also, it is preferred that the tiles have a felt or non-woven backing or release layer which works well with
25 releasable fastening tape, releasable adhesives, allows for vapor or moisture transport, is air permeable, and the like.

With reference to FIGS. 18A – 18D, the carpet composite, construction, or product of the present invention may have a design, pattern, color, and/or the
30 like printed, dyed, woven, or tufted therein.

With reference to FIGS. 18A and 18B, the carpet composite is dyed (or printed) in broadloom form (6', 12', 13'). With reference to FIG. 18C, the carpet tiles are cut into tile form and then dyed (or printed). With reference to FIG. 18D, the carpet composite is tufted (woven or knitted) with pre-colored, pre-dyed,
5 solution dyed, space dyed, or the like yarn to provide the pattern, design and/or colors.

Printing or dyeing of the carpet substrate in broadloom form provides for mass production economics of custom, one of a kind, or small orders which can be
10 printed one after another or nested and then cut apart, or large orders with no minimums, no inventory, direct ship to customer or store, and the like. Hence, custom or personally selected residential tiles can be produced with mass production economics and direct shipped to the customer or store.

15 It is preferred that the carpet composite, construction and/or tiles of the present invention include anti-microbial, anti-fungal, anti-bacterial agents, compounds, additives, or components, such as latex precoat, including BioCare® or AlphaSan™ anti-microbial agents, and/or the like. AlphaSan™ is a silver based anti-microbial agent marketed by Milliken & Company of Spartanburg,
20 South Carolina. An antimicrobial adhesive latex is described for example in U.S. Patent No. 6,342,212, hereby incorporated by reference.

Also, it is preferred that the carpet composite, construction or tiles of the present invention be capable of being recycled, refurbished, renewed and/or
25 the like as described in U.S. Patent Nos. 5,381,592 and 5,457,845 and U.S. Published Application No. 20020031636 A1, each hereby incorporated by reference herein.

Also, it is preferred that the products of the present invention provide value for
30 their price, are durable to high traffic, are resistant to separation (delamination), are quick and easy to install, are uniform after churns, provide a high level of

comfort, absorb noise, use recycled materials, can be disposed of or recycled environmentally, have a resilient face, have a resilient cushion, do not bottom out, have high foam strength, have high foam compressibility, are light weight, are made of low cost raw materials, have high compression recovery, provide
5 for choices in face materials, backing, cushion, color, design, pattern, size, and/or shape, have open cell foam, are air permeable at the seams and across the back, block water or liquids passing through the tile (hot melt layer), hide floor abnormalities, and/or the like.

10 With reference to FIGS. 65A – 66B, it is preferred that the cut pile residential tile be stamped or cut from the tile precursor or carpet composite by cutting from the back using, for example, controlled depth ultrasonic cutting (FIGS. 65A, 65B) or controlled depth die cutting (FIGS. 66A, 66B) using an air strike
15 die cut blade is a steel rule die with scalloped edges. Other forms of cutting such as laser, water jet, rotary reciprocating blade, band saw, and the like may be used.

It is, of course, to be appreciated that while several potentially preferred
20 embodiments, procedures and practices have been shown and described, the invention is in no way to be limited thereto, since modifications may be made and other embodiments of the principles of this invention will occur to those skilled in the art to which this invention pertains. Therefore, it is contemplated by the appended claims to cover any such modifications and other
25 embodiments as may incorporate the features of this invention within the true spirit and scope thereof.

CLAIMS

What we claim is:

- 5 1. A residential surface covering such as a wall covering, floor covering, carpeting, roll product, or carpet tile, comprising: a primary carpet, and a rebond foam cushion fixed at a position below said primary carpet.
- 10 2. The invention as recited in claim 1, further comprising at least one adhesive layer of at least one adhesive material between said primary carpet and said rebond foam cushion.
- 15 3. The invention as recited in claim 2, further comprising a layer of reinforcing material disposed between said primary carpet and said foam cushion.
- 20 4. The invention as recited in claim 2, wherein the adhesive material comprises at least one of a thermoplastic and thermoset adhesive.
- 5 20 5. The invention as recited in claim 1, wherein the primary carpet is a modern residential type carpet.
- 25 6. The invention as recited in claim 1, wherein the surface covering has a plurality of corners wherein each of said corners has a cup of about 3/16" or less and a curl of about 1/16" or less.
- 30 7. The invention as recited in claim 2, wherein the adhesive layer is present at a level of less than or equal to about 100 oz/yd².
8. The invention as recited in claim 2, wherein the adhesive layer is present at a level of about 10 – 90 oz/yd².

9. The invention as recited in claim 1, wherein the rebond foam cushion is characterized by a density of about 25 lbs. per cubic foot or less.
- 5 10. The invention as recited in claim 1, wherein the rebond foam cushion is characterized by a density of about 9 lbs. per cubic foot or less.
11. The invention as recited in claim 1, wherein the rebond foam cushion is characterized by an uncompressed chip size of about 25 mm or less.
- 10 12. The invention as recited in claim 11, wherein the uncompressed chip size is about 15 mm or less.
13. The invention as recited in claim 11, wherein the uncompressed chip size is about 7 mm or less.
- 15 14. The invention as recited in claim 1, wherein the rebond foam is characterized by a binder quantity of about 25% or less.
- 20 15. The invention as recited in claim 14, wherein the binder content is about 15% or less.
16. The invention as recited in claim 14, wherein the binder content is about 10% or less.
- 25 17. The invention as recited in claim 2, wherein the adhesive material comprises a hot melt adhesive.
18. The invention as recited in claim 1, wherein the primary carpet is characterized by a face weight of less than or equal to about 60 oz/yd².

19. The invention as recited in claim 17, wherein the hot melt adhesive is present at a level of about 15 – 50 oz/yd².
- 5 20. The invention as recited in claim 2, wherein the adhesive material comprises a polyolefin based thermoplastic hot melt adhesive.
21. The invention as recited in claim 1, wherein the primary carpet is at least one of a tufted, bonded, flocked, needle punched, and woven carpet.
- 10 22. The invention as recited in claim 1, wherein the rebond foam cushion is characterized by a thickness of about 25 mm or less.
23. The invention as recited in claim 22, wherein the foam thickness is about 12 mm or less.
- 15 24. The invention as recited in claim 22, wherein the foam thickness is about 8 mm or less.
- 20 25. The invention as recited in claim 2, wherein the adhesive material comprises a polyurethane thermoset adhesive.
26. The invention as recited in claim 1, wherein the rebond foam cushion includes a backing material bonded to one surface thereof.
- 25 27. The invention as recited in claim 1, wherein the primary carpet is a tufted carpet including pile yarn, primary backing, and a pre-coat adhesive.
- 30 28. The invention as recited in claim 1, wherein the primary carpet is a tufted carpet including pile yarn and a primary backing.

29. The invention as recited in claim 1, wherein the primary carpet is a bonded carpet including pile yarn and a backing material.
- 5 30. The invention as recited in claim 3, wherein said layer of reinforcing material comprises at least one of a porous scrim, woven, and non-woven material.
- 10 31. The invention as recited in claim 3, wherein said reinforcement material is formed of fiberglass.
32. The invention as recited in claim 3, wherein said reinforcement material comprises a porous textile structure.
- 15 33. The invention as recited in claim 3, wherein said reinforcement material consists essentially of polyester.
34. The invention as recited in claim 3, wherein said layer of reinforcing material comprises a plurality of glass fibers.
- 20 35. The invention as recited in claim 3, wherein said layer of reinforcing material comprises a plurality of polyester fibers.
- 25 36. The invention as recited in claim 3, wherein said adhesive material substantially permeates and covers the layer of reinforcing material and extends in bonding relation between said primary carpet and said rebond foam cushion such that said primary carpet and said rebond foam cushion are adhesively bonded to one another by said adhesive material.

37. The invention as recited in claim 3, wherein said primary carpet is a tufted carpet and wherein said adhesive material extends between said rebond foam cushion and the underside of said primary carpet.
- 5 38. The invention as recited in claim 3, wherein said primary carpet is a bonded carpet and wherein said adhesive material extends between said rebond foam cushion and the underside of said primary carpet fabric.
- 10 39. The invention as recited in claim 3, wherein said adhesive material substantially permeates and covers the layer of reinforcing material and extends in bonding relation between said primary carpet and said rebond foam cushion such that said primary carpet and said rebond foam cushion are adhesively bonded to one another by said adhesive material and wherein a layer of textile backing material is bonded to said rebond foam cushion across the surface of said rebond foam cushion facing away from said adhesive material.
- 15
40. The invention as recited in claim 1, wherein said rebond foam cushion is characterized by a density of about 6 to 12 lbs. per cubic foot.
- 20
41. The invention as recited in claim 1, wherein said primary carpet is a high twist frieze cut pile tufted carpet material.
- 25 42. The invention as recited in claim 1, wherein said rebond foam cushion is a rebond polyurethane foam having a uncompressed chip size of about 15 mm or less.
- 30 43. A residential surface covering such as a wall covering, floor covering, carpeting, roll product, or carpet tile, comprising: a primary carpet, a polyurethane rebond foam cushion disposed at a position below said

primary carpet, a mass of adhesive material disposed between said primary carpet and said rebond foam cushion and a layer of reinforcing material disposed between said primary carpet and rebond foam cushion such that at least a portion of said mass of adhesive material extends away from at least one side of said layer of reinforcing material.

5

44. The invention as recited in claim 43, wherein said surface covering has a shape of at least one of square, rectangular, triangular, diamond, hexagonal, octagonal, singular chevron on at least two sides thereof, multiple chevron on at least two sides thereof, singular lobe on at least one side thereof, and combinations thereof.

10

45. The invention as recited in claim 43, wherein said surface covering is adapted to be installed without adhesives.

15

46. The invention as recited in claim 43, wherein said surface covering resembles broadloom carpet, provides underfoot comfort, is easy to install, appears substantially seamless when installed, and combinations thereof.

20

47. The invention as recited in claim 43, wherein said carpet is tufted, said adhesive material is a hot melt adhesive, and said reinforcement material is a fiberglass mat.

25 48. A dimensionally stable cushioned residential suitable for disposition as discrete modular units across a flooring surface, the carpet tile comprising:

a primary carpet fabric having a pile side and a primary base with a plurality of pile forming yarns projecting outwardly from the pile side;

30

a rebond foam cushion layer disposed at a position below the primary carpet fabric; and

a bridging composite extending in bonding relation substantially between the primary base and an upper side of the rebond foam cushion layer wherein the bridging composite consists essentially of a layer of stabilizing material having a first side and a second side, a first layer of at least one resilient adhesive extending away from the first side of the stabilizing material into contacting relation with the primary base and a second layer of at least one resilient adhesive extending away from the second side of the layer of stabilizing material into contacting relation with the upper side of the rebond foam cushion layer such that the layer of stabilizing material is bonded between the first and second layers of resilient adhesive at a position between the primary base and the rebond foam cushion layer.

49. The invention as recited in claim 48, wherein the primary carpet fabric is a tufted carpet and wherein the primary base comprises a primary backing and a layer of adhesive pre-coat extending across the underside of the primary backing.

50. The invention as recited in claim 49, wherein the adhesive pre-coat comprises at least one of a latex and hot melt adhesive.

51. The invention as recited in claim 50, wherein the hot melt adhesive is bitumen based hot melt adhesive.

52. A residential carpet tile comprising a carpet layer and a backing attached thereto and having at least one layer comprised of compressible particles bonded together.

53. A cushion back carpet tile comprising a carpet layer and a cushion back attached thereto and having at least one layer comprised of preformed foamed polyurethane particles bonded together.

54. A residential foam backed carpet tile with slit or peeled foam.
55. A residential foam backed carpet tile with open celled foam comprised
5 of foamed polyurethane particles bonded together.
56. The foam backed carpet tile of claim 59 with an average uncompressed
particle size of 15 mm or less.
- 10 57. A foam backed carpet tile with a flame laminated foam backing of at
least 25% polyester urethane foam.
58. A residential cushion backed carpet tile with a carpet layer and a
skeletal structured foam cushion.
- 15 59. A residential cushion backed carpet tile including a carpet layer and a
backing layer with a total backing layer weight of less than 50 oz/yd².
60. A residential carpet tile comprising a carpet layer and a backing
20 attached thereto and having at least one layer comprised of foamed
open cell particles bonded together.
61. A residential carpet tile comprising a carpet layer, a stabilizing layer, and
a backing wherein at least one of said stabilizing layer and backing have
25 at least one layer comprised of preformed compressible particles bonded
together.
62. A residential cushion back carpet tile comprising a carpet layer, a
stabilizing layer, and a cushion back having at least one layer comprised
30 of preformed compressible particles bonded together.

63. The carpet tile of claim 62, wherein said tile has a non-rectangular shape which provides for interlocking with adjacent or abutting carpet tiles in a carpet tile installation.
- 5 64. A carpet tile installation of a plurality of the carpet tiles of claim 63.
65. A carpet tile having a recycled foam content of at least 50%.
- 10 66. The carpet tile as recited in claim 65, having a recycled foam content of at least 85%.
- 15 67. A cushion back carpet tile having a textile face, a cushion backing, and a peripheral shape providing for interlocking of adjacent carpet tiles and comprising at least one protruding chevron on at least one side thereof and at least one corresponding indented chevron on an opposing side thereof.
- 20 68. The carpet tile as recited in claim 67, wherein said peripheral shape providing for interlocking of adjacent carpet tiles comprises at least two protruding chevrons on at least one side thereof and at least two corresponding indented chevrons on an opposing side thereof.
- 25 69. A cushion back carpet tile having a textile face, a cushion backing, and a peripheral shape providing for interlocking of adjacent carpet tiles and comprising at least one protruding chevron on at least two sides thereof and at least one corresponding indented chevron on opposing sides thereof.
- 30 70. A cushion back carpet tile having a modern residential carpet face, a cushion backing, and a peripheral non-rectangular shape providing for interlocking of adjacent carpet tiles and comprising at least one

protruding element on at least one side thereof and at least one corresponding indented element on the opposing side thereof.

- 5 71. The carpet tile as recited in claim 70, wherein said carpet tile resembles broadloom carpet, provides underfoot comfort, and appears substantially seamless when installed properly.
72. A carpet tile installation of a plurality of the carpet tiles of claim 70.
- 10 73. A carpet tile, comprising: a pile fabric face with a primary backing composite of a woven layer, a non-woven material needled and calendered thereto and containing at least 10% by weight low melt material and a cushion layer below said face.
- 15 74. A carpet tile, comprising: a pile fabric, cushion layer below said fabric, and a grip layer on the bottom of said cushion layer and at least providing lateral grip.
- 20 75. A modular carpet tile product having the look and feel of residential broadloom carpet when installed properly, comprising: a residential carpet face, and a cushion backing including a foam layer with a density of about 5 – 12 lbs./per cubic foot and a thickness of about 4 – 12 mm.
- 25 76. The product of claim 75, further including a stabilizing layer providing for dimensional stability.

Y	US 5,616,200 A (HAMILTON et al.) 01 April 1997 (01.04.1997), col. 1, lines 22-27 and col. 4, lines 22-44.	51
Y	US 3,874,964 A (COGLIANO et al.) 01 April 1975 (01.04.1975), abstract and Figures 1 and 4	54

☒ Further documents are listed in the continuation of Box C.

☐ See patent family annex.

* Special categories of cited documents:	
"A" document defining the general state of the art which is not considered to be of particular relevance	"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
"E" earlier application or patent published on or after the international filing date	"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
"O" document referring to an oral disclosure, use, exhibition or other means	"&" document member of the same patent family
"P" document published prior to the international filing date but later than the priority date claimed	

Date of the actual completion of the international search
